  MEDLINE   83143306
COMMENT     [1] also sequenced the 21S rRNA gene sequences of omega alleles
            omega(-) and omega(n). [1] describes a long uninterrupted reading
            frame (3886-4593) able to specify a 235 amino acid polypeptide
            within the intron, and discusses the possibly recent insertion of
            introns and a mechanism for splicing after the assembly of the
            large ribosomal subunit. [2] determined the gene splice points by
            comparison to the s.carlsbergensis 21s rrna gene sequence. [4]
            found many stretches of given sequence homologous to E.coli 23S
            rRNA.
            The short (66 bp) exonic insert (mini-insert) found in omega(+)
            strains occurs at 3366-3432; this insert is transcribed into the
            mature rRNA without excision [4].
            r-c-321 refers to a chloramphenicol-resistant mutation. The r-e-514
            (erythromycin resistant) mutant characteristic of the i18-8c strain
            is at 2851 (located by [4], but wild-type allele not given).
               EMBL features not translated to GenBank features:

            * This sequence is unfinished. It consists of 12 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *         1    10151: contig of 10151 bp in length
            *                     gap of unknown length
            *     10152    14350: contig of 4199 bp in length

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.
```

```
            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-4, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is H_DJ0650P09.  Actual start of
            this clone is at base position 1 of DJ0650P09.

            This clone contains STS sWSS2917 (NID:g1113644).

            ***                                                        ***
            * This sequence is unfinished. It consists of 27 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *      1     1891: contig of 1891 bp in length
            *   1892     3562: gap of unknown length
            *   3563     5221: contig of 1659 bp in length
            *   5222     6892: gap of unknown length
            *   6893     8031: contig of 1139 bp in length
            *   8032     9702: gap of unknown length
            *   9703    11259: contig of 1557 bp in length
            *  11260    12930: gap of unknown length
            *  12931    14177: contig of 1247 bp in length
            *  14178    15848: gap of unknown length
            *  15849    17357: contig of 1509 bp in length
            *  17358    19028: gap of unknown length
            *  19029    20303: contig of 1275 bp in length
            *  20304    21974: gap of unknown length
            *  21975    23701: contig of 1727 bp in length
            *  23702    25372: gap of unknown length
            *  25373    27009: contig of 1637 bp in length
            *  27010    28680: gap of unknown length
            *  28681    30188: contig of 1508 bp in length
            *  30189    31858: gap of unknown length
            *  31859    33215: contig of 1357 bp in length
            *  33216    34885: gap of unknown length
            *  34886    36494: contig of 1609 bp in length
            *  36495    38164: gap of unknown length
            *  38165    40053: contig of 1889 bp in length
            *  40054    41723: gap of unknown length
            *  41724    43481: contig of 1758 bp in length
            *  43482    45151: gap of unknown length

            * This sequence is unfinished. It consists of 10 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1     1249: contig of 1249 bp in length
            *    1250     3162: gap of unknown length
            *    3163     6300: contig of 3138 bp in length

COMMENT     On Jul 8, 1998 this sequence version replaced gi:3219317.
```

```
            Sequencing is completed to a minimum standard of double strand
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.

            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.

            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.

            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

  TITLE     Characterization of the lep operon of Escherichia coli:
            Identification of the promoter and the gene upstream of the signal
            peptidase I gene
  JOURNAL   J. Biol. Chem. 260, 7206-7213 (1985)
  MEDLINE   85207751
COMMENT     Positions 1 to 2220 and 3101 to 3131 are from [2]; positions 2221
            to 3100 are from [1].
            The data in [2] were kindly submitted on diskette by P.E.March,
            (02-SEP-1985).
            A promoter region containing a -35 region (positions 185-190) and a
            -10 region (positions 206-212) was identified for the lepA gene.  A
            potential ribosome binding site for the lep gene was identified at
            2092-2096.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                     from 4 enterococcal endocarditis patients and a rabbit
                     immunized with surface proteins from an E. faecalis
                     isolate. Cosmid DNA from immunopositive cosmid clones was
                     treated with DNase I, the ends were filled with the Klenow
                     fragment, and then ligated into the EcoRV site in
                     pBluescript SK(-). The ligation mixture was transformed
                     into XL1Blue MRF', and the transformants were screened
                     with antisera. The immunopositive clones were selected for
                     DNA sequencing."

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track served to identify it as a clone from the normalized
            adult NRBmedulla library. cDNA Library Preparation: M. Fatima
            Bonaldo, Ph.D. Clone distribution: clones will be available through
            Research Genetics The following repetitive elements were found in
            this cDNA sequence: 1-64, >AT_rich#Low_complexity 186-290,
            >B1_MM#SINE/Alu
            Seq primer: M13 Forward.
FEATURES             Location/Qualifiers
     source          1. .404
                     /organism="Rattus norvegicus"
                     /strain="Sprague-Dawley"
                     /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                     polylinker; Site_1: Not I; Site_2: Eco RI; This library
                     (UI-R-BT0) consists of a mixture of individually tagged
                     normalized libraries constructed from rat hippocampus,
                     thalamus, mid-brain, medulla, corpus striatum, cerebral
                     cortex and testis. The tag used to  identify the source
                     tissue is a string of 3-6 nucleotides present  between the
                     Not I site and the oligo-dT track which allows
                     identification  of the library of origin of a clone within
                     the mixture. This library was then subtracted using a
                     driver consisting of a mixture of all clones from UI-R-A0,

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1038; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer.. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   New expression cassettes inducible by methanol and/or glycerol -
PT   having promoter and terminator derived from alcohol oxidase gene
PS   Claim 1; Page 14-15; 37pp; English.
CC   An expression cassette which contains the alcohol oxidase promoter
CC   is induced when in the presence of methanol/glycerol.  Under such
CC   conditions any heterologous gene located downstream of the promoter
CC   will be expressed.  The expression cassette can be used to construct
CC   an expression vector which in turn can be used to transform cells.
CC   When transformed cells are cultured in the presence of methanol/
CC   glycerol expression of the heterologous gene is induced such that
CC   large quantities of the desired product is produced.  The
CC   transformed cells are used particularly for the production of
CC   enzymes such as adenylate kinases, cytochrome C and peroxidases.

PT   Prepn. of recombinant fowl pox virus for e.g. expression of
PT   proteins - by inserting foreign DNA into enlarged inter-genic
PT   region so FPV TK-gene remains intact and codes for entire
PT   thymidine kinase
PS   Disclosure; Page 31; 92pp; English.
CC   The sequences given in Q41027-45 are oligomers which were used in the
CC   construction of the insertion plasmids of the invention.  These
CC   plasmids comprised the fowl pox virus (FPV) P2 promoter sequence (see
CC   Q41013 and Q41018-20), multiple cloning sites (see Q41015-16), the FPV
CC   thymidine kinase (tk) gene and the tk gene intergenic region (see also
CC   Q41011-12).  The P2 promoter belongs to one of the strongest natural
CC   promoters in vaccina virus (VV) infected cells.  These plasmids may be
CC   used to express foreign proteins which require post-translational
CC   modification eg. Factors II, V, VII, VIII, IX, X, XI, XII, XIII,
CC   proteins C and S, von Willebrand factor, plasminogen and derivatives,
CC   apolipo proteins, eg. apoAI and apoAII, and viral antigens, eg.
CC   hepatitis B- antigens and the antigens of hepatitis C and E viruses,
CC   of tickborne encephalitis (TBE) virus, antigens of HIV, HSV and whole
CC   or partial sequences of antigens which cause pertussis, infectious
CC   bronchitis, tetanus, malaria, Marck's disease and Newcastle disease,
CC   these antigens being useful as vaccines.

PT   Probe nucleic acids, target binding assemblies, etc - for detection
PT   and localisation of specific nucleic acid sequences, esp. HIV and
PT   HPV
PS   Disclosure; Page 84; 172pp; English.
CC   T30615-T30634 represent probe nucleic acids of the invention.  The probe
CC   of the invention contains a target binding region (TBR), a booster
CC   binding region (BBR), and an optional support or attachment (OSA).  The
CC   target binding assembly (TBA) recognised by the TBR (see T30581-T30614)
CC   of the probe, contains at least one nucleic acid recognition unit (NAR),
CC   and optionally a linker sequence, an assembly sequence (see
CC   R95994-R95998), an asymmetry sequence (see R95999-R96006), a nuclear
CC   localisation signal sequence (see R96007), and an OSA.  The assembly
CC   sequence and asymmetry sequences are responsible for the folding and
CC   association of the NARs.  The NARs (see R95965-R95993) are selected from
CC   NF-kappa-B, SP1, TATA, human papillomavirus (HPV) E2, HPV LTR, human
CC   immunodeficiency virus (HIV) LTR and Tat binding units.  The linker
CC   sequence is an oligopeptide, which does not interfere with NAR function,
CC   but provides stability and control over the spacing of the NAR from the
CC   rest of the TBA.  The OSA is an attached support or indicator, or other
CC   means of localisation of the probe.  The probe can be used in a method
CC   for detecting or localising a specific target nucleic acid sequence
CC   (TNA).  The method is highly sensitive, and has a high degree of
CC   specificity.  The method can be used for detecting specific nucleic acid
CC   sequences, including those found in human cells, in HIV, HPV, and other
CC   nucleic acid containing systems, including bacteria and viruses.

PT   Treating papilloma virus infections, by repressing E6 and E7
PT   oncogenic proteins - using E2 polypeptide or nucleic acid encoding
PT   it, useful for treating warts and cervical cancer
PS   Disclosure; Pages 48-49; 71pp; English.
CC   The present sequence encodes the human papillomavirus-16 (HPV-16)
CC   E2 protein.
CC   Papillomavirus infections can be treated by administering an E2
CC   protein, comprising a DNA-binding and transcription activating
CC   domain, or the gene encoding the E2 protein to infected cells. The
CC   method is applicable to livestock, zoo animals, pets and humans,
CC   specifically for the treatment, prevention or reversal of warts,
CC   e.g. plantar, common, Butcher's common, flat or genital warts, or
CC   epidermodysplasia verruciformis, or growth of papillomavirus
CC   transformed cells, especially laryngeal papilloma or cervical
CC   carcinoma.

PT   New nucleic acid sequences encoding bovine diarrhoea virus
PT   glycoprotein(s) - and derived, recombinant viruses, expression
PT   vectors, proteins etc., useful in protective vaccines
PS   Claim 3; Page 21-22; 37pp; French.
CC   This sequence encodes the gE1 structural protein from the Osloss
CC   strain of BDV (gE1 is called gp62 by Collett et al., Virology 165:
CC   200-208, 1988). The epitopes of neutralising antibodies which
CC   recognise BDV have been localised to the viral structural proteins.
CC   The invention includes sequences with homology to the nucleotide
CC   sequence encoding gE1, at least the first 273 amino acids of gE2
CC   (also called gp53) and combinations of gE1 with at least part of
CC   gE2 and opt. the other structural (non-glycosylated) protein C
CC   (also called p20).  See also Q32249-Q32255.

PT   New isolated protein necessary for HIV replication - which mediates
PT   the Rev response, useful for developing prods. for the study and
PT   treatment of viral infection
PS   Example 1; Page 37-40; 73pp; English.
CC   A DNA sequence (T59675) codes for hRIP (W12713), a novel human
CC   cellular cofactor required to mediate the Rev response necessary
CC   for HIV replication.  hRIP binds to HIV Rev protein and is
CC   essential for Rev activity.  Full-length HIV-1, Rev mutants and
CC   HTLV-I Rex proteins were fused to LexA (1-202) by PCR.  A two-
CC   hybrid screen was performed using an activation domain-tagged HeLa
CC   cDNA library and the LexA construct as a bait in yeast strain
CC   EGY48.  Primary positive plasmids were retransformed into EGY48
CC   expressing LexA, LexA-Rev or LexA-revM10 and contg. the lacZ
CC   reporter plasmid pSH18-34.  A clone contg. a hRIP fragment was
CC   obtd. and used to screen a human placental cDNA library to obtain
CC   the full-length hRIP DNA.  The DNA can be used to produce
CC   recombinant hRIP in host cells for use in developing prods. for
CC   the study and treatment of retroviral infections.

PT   New DNA encoding cellular co:factor for HIV Rev and related proteins
PT   - used for screening cpds. able to modulate rev-co:factor
PT   interaction for control of HIV and other viral infections
PS   Claim 3; Page 33-36; 55pp; English.
CC   T79881 encodes a cellular co-factor for HIV-1 Rev and other related
CC   proteins. The protein is called Rab (Rev/Rex activation domain
CC   binding) protein as it bind most strongly to HIV-1 Rev and HTLV-1
CC   Rex. HIV-1 Rev is required for the nucleocytoplasmic transport and
CC   hence translation of a class of incompletely spliced mRNAs that
CC   encode the viral structural proteins. In the absence of Rev, these late
CC   viral RNAs remain sequestered in the nucleus until they are either
CC   spliced or degraded. Rev function is therefore essential for the
CC   production of progeny virions by HIV-1 infected cells. Rex has an
CC   equivalent function for HTLV-1. Rab and DNA encoding it can be used
CC   for screening for compounds that inhibit formation of complexes
CC   between Rev/Rex and Rab, preventing activation of these proteins.
CC   Such compounds are useful for treating lentivirus or HTLV infection.

PT   Antibodies to cadherin proteins - useful as cadherin antagonists,
PT   etc.
PS   Example 2; Columns 91-96; 59pp; English.
CC   The present sequence encodes full length human cadherin-11, which
CC   is a Ca2+ dependent cell adhesion protein. The human cadherin cDNA
CC   was isolated from a foetal brain cDNA library, using probes based
CC   on homologous rat cadherin cDNA.
CC   Antibodies or fragments that specifically bind the human cadherin
CC   can be used to purify the cadherin, determine its tissue expression
CC   and antagonise its ligand/antiligand binding activities.

PT   Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion
PS   Example 2; Column 87-90; 56pp; English.
CC   This sequence encodes human cadherin-11.  The invention specifically
CC   provides details of human cadherin-5, -8, -11, -12 and -13, and rat
CC   cadherin-8, -5, -11 and -13.  Cadherins are calcium-dependent cell
CC   adhesion proteins.  They are glycosylated integral membrane proteins
CC   that have an N-terminal extracellular domain that determines binding
CC   specificity, a hydrophobic membrane spanning region and a C-terminal
CC   cytoplasmic domain, which is highly conserved among members of the
CC   superfamily.  The C-terminal domain interacts with the cytoskeleton
CC   through eatenins and other cytoskeleton-associated proteins.  The
CC   novel cadherin proteins may be used in the analysis of the role of
CC   cadherins in various cancers.  Sequence analysis of the cadherin
CC   proteins also allows investigation of the structure and function of
CC   cadherin.  The cadherin proteins may be isolated by using anti-cadherin
CC   antibodies.  These antibodies may also be used to modulate the activity
CC   of cadherin and to determine the tissue specific distribution of cadherin
CC   proteins.  Each subclass of cadherins has a unique tissue distribution
CC   pattern.

PT   Evaluating risk of cervical dysplasia or cervical cancer - by
PT   deteting variant form of human papilloma virus 16
PS   Claim 1; Column 9-16; 33pp; English.
CC   Methods have been developed for distinguishing a subset of human
CC   papilloma virus (HPV) that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The methods involve:
CC   (1) preparing a cervical sample to expose any HPV-16 E6 gene in the
CC   sample and determining if the base at position 350 of the E6 gene
CC   (see T94723 and T94724 for comparison) is T or G, where the presence of
CC   G at position 350 is associated with an increased risk of developing
CC   cervical dysplasia or cervical cancer; and (2) preparing a cervical
CC   sample to expose any HPV-16 E6 protein in the sample and determining
CC   if the amino acid at position 83 of the protein (see position 90 in
CC   W35741 and w35742 for comparison) is Val or Leu, where the presence of
CC   Val at position 83 that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The present sequence
CC   represents the reference nucleotide sequence for HPV-16 E6. The 350G
CC   variant correlates well with Pap scores: 350T:350G ratios among 45
CC   HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for
CC   CIN II; 2:9 for CIN III; 0:3 for cancer.

PT   Evaluating risk of cervical dysplasia or cervical cancer - by
PT   detecting variant form of human papilloma virus 16
PS   Claim 1; Column 15-24; 33pp; English.
CC   Methods have been developed for distinguishing a subset of human
CC   papilloma virus (HPV) that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The methods involve:
CC   (1) preparing a cervical sample to expose any HPV-16 E6 gene in the
CC   sample and determining if the base at position 350 of the E6 gene
CC   (see T94723 and T94724 for comparison) is T or G, where the presence of
CC   G at position 350 is associated with an increased risk of developing
CC   cervical dysplasia or cervical cancer; and (2) preparing a cervical
CC   sample to expose any HPV-16 E6 protein in the sample and determining
CC   if the amino acid at position 83 of the protein (see position 90 in
CC   W35741 and W35742 for comparison) is Val or Leu, where the presence of
CC   Val at position 83 that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The present sequence
CC   represents the variant nucleotide sequence for HPV-16 E6. The 350G
CC   variant correlates well with Pap scores: 350T:350G ratios among 45
CC   HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for
CC   CIN II; 2:9 for CIN III; 0:3 for cancer.

PT   Novel hybridisation assay for the detection of eubacteria - esp
PT   Mycobacterium, comprises amplifying the 16S-23S rRNA spacer region
PS   Claim 9; Fig 34; 248pp; English.
CC   The sequences given in T11889-905 represent the 16S-23S rRNA spacer
CC   regions derived from various microorganisms.  These sequences were
CC   used in the method of the invention for the detection and identification
CC   of at least one or more microorganisms.  The method comprises amplifying
CC   the 16S-23S rRNA spacer region and hybridising one or more probes to
CC   the amplified sequence.  These probes were specifically used to detect
CC   microorganisms in samples originating from food.  This spacer region is
CC   derived from Mycobacterium ITG 8723.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1177; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
```

```
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Amplification method avoiding strand displacement by polymerase -
PT   used in the detection of mutation(s) and allele(s) associated with
PT   genetic disease and cancer
PS   Example 1; Page 50-51; 92pp; English.
CC   This sequence represents the multidrug resistance gene (MDR-1) amplified
CC   by the primers shown in T43320 and T43321. This sequence can be used as a
CC   target in the method of the invention, for enzymatically amplifying a
CC   target nucleic acid (TNA) sequence contained in a nucleic acid or mixture
CC   of nucleic acids while avoiding strand displacement by polymerase. The
CC   method comprises using three primers, one complementary to a first
CC   segment of the TNA, a second complementary to a second segment of the
CC   TNA, which is adjacent to the first primer, and a third which is similar
CC   to the first segment of the TNA, and is complementary to a portion of the
CC   first primer. The first two primers are hybridised to the TNA, and a
CC   fused amplification product is created from the TNA using these two
CC   primers. The fused product is dissociated, and hybridised to the third
CC   primer, which is then extended. The extended modified amplification
CC   product is hybridised to the first two primers, and these two primers are
CC   ligated. Each of the primers may be labelled using a different label so
CC   that the method can be used to detect the presence of a mutation or
CC   allele by detecting whether the labelled primer is contained within the
CC   fused amplification product or the extended amplification product. The
CC   method of the invention combines certain aspects of ligase chain reaction
CC   (LCR) and polymerase chain reaction (PCR), but is improved compared to
CC   LCR due to the reduced number of primers needed, and the fact that the
CC   entire TNA sequence does not need to be known.

PT   Lipsomes for delivering protein, nucleic acid etc. to hair
PT   follicles - e.g. to restore hair colour, prevent hair loss during
PT   chemotherapy, stimulate hair growth etc.
PS   Claim 8; Page 70-77; 100pp; English.
CC   The nucleotide sequence of the human multidrug resistance (MDR-1) gene
```

```
CC   which encodes a p-glycoprotein.  This is an example of a compound which
CC   can be delivered to hair follicles via a novel liposome composition.  The
CC   liposomes are comprised of a lipophilic or lipophobic compound which will
CC   selectively target the hair follicle (via the stratum corneum) without
CC   damaging or unwanted effects on cells outside the follicle.  Compounds
CC   e.g. p-glycoprotein, can be delivered to the hair follicle for treatment
CC   of chemotherapy-induced alopecia.  Other compounds targeted at hair
CC   follicles can include: tyrosinase (or the DNA encoding it - Q72871),
CC   melanin or hair dyes (to restore hair colour or condition); human
CC   transforming growth factor-alpha (Q72873)(for reversal of wavy hair);
CC   hair growth stimulants (e.g. cyclosporin A or aromatase) or antisense
CC   sequences.  The method allows compounds (e.g. macromolecules or
CC   polymers), which would not normally reach the hair follicles, to be
CC   delivered to these target areas.

PT   DNA for multi-drug resistance in human cells - used to detect
PT   chemotherapy-resistant tumour cells and for producing
PT   polypeptide(s) for diagnosis and therapy
PS   Claim 2(a); Table 5, pp30-39; 61pp; English.
CC   The human multi-drug resistant KB carcinoma cell lines were used as
CC   the source of the mdr1 gene nucleic acid sequences (N70751). To
```

```
CC   obtain cDNA clones of the mdr1 gene (N70752), poly (A) and RNA was
CC   used. Analysis of the AA sequence presented in (N70752) indicates
CC   that the mdr1 gene product is likely to be a transmembrane protein.
CC   The presence of transmembrane domains and potential glycosylation
CC   sites is consistent with the mdr1 protein being related to the
CC   P-glycoprotein.

PT   Methods of influencing flowering characteristics of plants - by
PT   administration of FCA protein, DNA or antisense transcripts
PS   Claim 20; Fig 8a; 97pp; English.
CC   The FCA gene (T43225) of Brassica napus codes for a polypeptide
CC   (W06449) able to influence flowering characteristics, partic.
CC   flowering time.  It was isolated from a genomic library using
CC   a cDNA clone obtd. from the Arabidopsis FCA gene (T43224).  The
CC   gene fully complements a mutation in the Arabidopsis FCA gene
CC   and is thus a fully functional homologue.  Timing of flowering of
CC   transgenic plants can be delayed or hastened using FCA sense and
CC   antisense constructs, mutants and alleles.  FCA genes can also be
CC   used to isolate FCA homologues from other plant species.

PT   Methods of influencing flowering characteristics of plants - by
PT   administration of FCA protein, DNA or antisense transcripts
PS   Claim 2; Fig 1; 97pp; English.
CC   The FCA gene (T43224) of Arabidopsis thaliana codes for a
CC   polypeptide (W06448) able to influence flowering characteristics,
CC   partic. flowering time.  It was identified by fca mutant
CC   complementation analysis using cosmid clones.  The FCA transcript
CC   is alternatively spliced; 5 forms of the transcript (see also
CC   T43226) are generated in cells.  The timing of flowering of
CC   transgenic plants can be delayed or hastened using FCA sense and
CC   antisense constructs, mutants and alleles.  The Arabidopsis FCA
CC   gene can also be used to isolate FCA homologues, e.g. from Brassica
CC   napus (see also T43225).

PT   New human calcium sensor protein and vector encoding inhibitor of gp
PT   330 mediated transport of amyloid beta protein - useful to treat
PT   membraneous glomerulonephritis and central nervous system disorders
PS   Claim 2; Page 112-130; 240pp; English.
CC   This is a full-length sequence coding for human placenta calcium
CC   sensor protein (hCSP) (see W43312).  It was obtained by PCR
CC   amplification using primers (see V06001-16) derived from another
CC   hCSP cDNA sequence (see V05994).  Full-length sequences for human
CC   kidney (see V05996) and parathyroid (see V05997) hCSP were
CC   similarly obtained.  hCSP is considered to be the human homologue
CC   of rat Heymann nephritis antigen gp330 on the basis of sequence
CC   similarity.  It is proposed that the calcium sensor is a universal
CC   sensor for recognition of variation in extracellular calcium, and
CC   plays a key role in calcium regulation via different organ systems.
CC   Vectors comprising hCSP cDNA and host cells expressing the cDNA are
CC   claimed.  Also claimed are methods: of using hCSP to treat human
CC   membraneous glomerulonephritis; of using hCSP to screen for
CC   agonists and antagonists of hCSP (for use e.g. in the treatment of
CC   osteoporosis or hyperthyroidism); of using hCSP antisense nucleic
CC   acids to down-regulate or block expression of hCSP; and of using
CC   human gp330 antisense RNA to treat a central nervous system
CC   disorder characterised by beta-amyloid protein accumulation,
CC   especially Alzheimer's disease.

PT   New human calcium sensor protein and vector encoding inhibitor of gp
PT   330 mediated transport of amyloid beta protein - useful to treat
PT   membraneous glomerulonephritis and central nervous system disorders
PS   Claim 2; Page 80-98; 240pp; English.
CC   This is a full-length sequence coding for human calcium sensor
CC   protein (hCSP) (see W43311).  It is derived from cDNA clone CAS-2
CC   (see V05993), which was isolated from a human placenta cDNA
CC   library, and from a cDNA clone obtained by probe screening of
CC   a human kidney cDNA library.  PCR primers (see V06001-16) based
CC   on this sequence were used in the PCR amplification of full-length
CC   clones (see V05995-97) coding for placental, kidney and parathyroid
CC   hCSPs (see W43312-14).  hCSP is considered to be the human
CC   homologue of rat Heymann nephritis antigen gp330 on the basis of
CC   sequence similarity.  It is proposed that the calcium sensor is a
CC   universal sensor for recognition of variation in extracellular
CC   calcium, and plays a key role in calcium regulation via different
CC   organ systems.  Vectors comprising hCSP cDNA and host cells
CC   expressing the cDNA are claimed.  Also claimed are methods: of
CC   using hCSP to treat human membraneous glomerulonephritis; of using
CC   hCSP to screen for agonists and antagonists of hCSP (for use e.g.
CC   in the treatment of osteoporosis or hyperthryoidism); of using hCSP
CC   antisense nucleic acids to down-regulate or block expression of
CC   hCSP; and of using human gp330 antisense RNA to treat a central
CC   nervous system disorder characterised by beta-amyloid protein
CC   accumulation, especially Alzheimer's disease.

CC   A cDNA clone (T28773) codes for a 500 kDa human calcium sensor
CC   protein (CSP = R97208).  It was obtd. by RT-PCR amplification and
CC   32P-labeled probe screening of human kidney cDNA libraries and by
CC   sequencing of placental cDNA clone pCAS-2 (see also T28772).  Other
CC   full-length CSP cDNA clones were also obtd. from the placenta, kidney
CC   and parathyroid (see also T28774-76).  These sequences can be used for
CC   prodn. of recombinant CSP.  Transformed host cells expressing CSP are
CC   used to identify CSP (ant)agonists and in diagnostic and therapeutic
CC   applns.  Antisense sequences capable of down-regulating or blocking
CC   CSP expression can also be produced.

PT   Polypeptide having trypsin inhibitory activity - for the treatment
PT   of pancreatitis, shock, multi-organ failure, etc.
PS   Example 9; Page 16; 25pp; Japanese.
CC   A polypeptide having trypsin inhibitory activity, mol.wt. 22-28 kD
CC   or 17-23 kD (as determined by SDS-PAGE under reducing or non-
CC   reducing conditions, respectively) and an N-terminal sequence as in
CC   R79913 is claimed. The polypeptide was isolated from human T98G
CC   cells and is useful for treating pancreatitis, shock, multiple
CC   organ failure and disseminated intravascular coagulation. The
CC   present sequence is that of an antisense RACE-PCR primer used for
CC   cloning coding sequences for the full-length polypeptide into
CC   plasmid pUC118.

PT   Determn. of the sensitivity of mycobacterial cells to antimicrobial
PT   agents  - using oligo:nucleotide probes specific for rRNA precursors
PS   Claim 17; Page 60; 79pp; English.
CC   T35571-T35625 represent probes for mycobacterial pre-rRNA.  T35609-T35616
```

```
CC   are probes specific for M.leprae pre-rRNA.  These sequences are used in a
CC   method for detecting pre-rRNA in mycobacterial cells.  In this method,
CC   the cells are treated enzymatically or mechanically to expose the cell
CC   membrane.  The cell is then treated with lysis reagents to release (but
CC   not degrade) the pre-rRNA.  The pre-rRNA is then detected using at least
CC   one of these probe sequences.  The method can be used to determine the
CC   sensitivity of mycobacterial cells to antimicrobial agents (such as
CC   rifampicin), and thereby detect antibiotic-resistant cells.  The method
CC   is also useful to determine the antimicrobial efficacy of a compound.

PT   Assay for pre-ribosomal RNA in mycobacterium cells - by
PT   hybridisation with specific probes after cell lysis
PS   Claim 11; Column 87; 54pp; English.
CC   The present sequence represents a mycobacterial pre-ribosomal RNA
CC   (pre-rRNA) target sequence. The present invention describes a method for
CC   detecting pre-rRNA in cells of a mycobacterial sample. The method
CC   comprises: (a) treating the cells to release pre-rRNA by: (i)
CC   pretreating the cells by enzymatic degradation using both lysozyme and
CC   protease until their cell walls are rendered porous to expose their cell
CC   membranes, making the cells susceptible to lysis; (ii) contacting the
CC   pretreated cells with a combination of a magnesium chelator, a nonionic
```

```
CC   detergent and an anionic detergent; and (iii) heating the cells to 75-99
CC   degrees Celsius until the mycobacterial cells are lysed; and (b)
CC   detecting the pre-rRNA using at least one oligonucleotide probe which is
CC   capable of selectively hybridising to a region of the pre-rRNA that is
CC   not present in a mature mycobacterial rRNA. The probes can be used to
CC   identify many Mycobacterium spp. including M. tuberculosis, M. leprae,
CC   M.  habana, M. avium, M. bovis, M. lufu, M. paratuberculosis, M.
CC   marinum, M. simiae and/or M. intracellulare. The probes may also be used
CC   to measure mycobacterial response to inhibitors of RNA and protein
CC   synthesis and may therefore be used to screen new antimycobacterial
CC   drugs. Mycobacteria have a slow growth rate. By using the probes, drug
CC   developers can now identify compounds that are more effective, but less
CC   stable than those previously identified.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1497; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
```

```
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT for diagnosis of abnormal cell function, by preparing cDNA that
PT reflects relative abundance of corresp. mRNA in specific human
PT tissues
PS Claim 1; Page 2075; 2245pp; Japanese.
CC A single-stranded DNA (or its complementary strand or the corresp.
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC given in T19001-T26837 and which is able to hybridise to part of
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC sequences were obtained from 3'-directed cDNA libraries prepared
CC from various human tissues; synthesis of cDNA was initiated from the
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC untranslated sequence is unique to a particular mRNA species, almost
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC is constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.
CC The appearance frequency of a given GS in a cDNA library can be
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
CC recognising different cell types.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

            MAPPING: Clones were assigned to the YAC map by hybridization by
            M. Lodhi, Cold Spring Harbor Laboratories, and fingerprinted
            by M. Marra, WashU, to pick the best candidates for sequencing.

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:

            The 5' clone is F7N22; 3' clone is T26D22, 200 bp overlap.  Actual
            end is at 6603 of T26D22.

            The assembly of the tandem region from base 48777 to 73335 cannot
            be guaranteed. The region contains sequence which is single
            stranded, and of low quality. Restriction digest with HINDIII shows
            a 25 kb band, which is consistent with the submitted sequence.

            * This sequence is unfinished. It consists of 20 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *      1     3549: contig of 3549 bp in length

    TITLE     Direct Submission
    JOURNAL   Submitted (24-MAR-1998) The Institute for Genomic Research, 9712
              Medical Center Dr., Rockville, MD 20850, USA
  COMMENT     On Mar 24, 1998 this sequence version replaced gi:2924795.
              Address all correspondence to: Mark Adams The Institute for Genomic
              Research 9712 Medical Center Dr, Rockville, MD 20850, USA e-mail
              address: mdadams@tigr.org.   The orientation of the sequence is
              from SP6 end to T7 end. Genes were identified by a combination of
              five methods including: XGRAIL (available by anonymous ftp from
              arthur.epm.ornl.gov), Genefinder (Phil Green, University of
              Washington), Genscan  (Chris Burge,
              http://gnomic.stanford.Edu/~chris/GENSCANW.html)searches of the
              complete sequence against a peptide database,and the Human gene
              Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html).
              Genes without pepetide homolgy having spliced EST hits are termed
              'Unknown gene product'. Genes encoding tRNAs are predicted by
              tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).

  JOURNAL   Submitted (15-JUL-1997) Molecular and Human Genetics, Baylor
            College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
COMMENT     Sequencing is completed to a minimum standard of double strand
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.

            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.

            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.

            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

COMMENT     On Sep 24, 1998 this sequence version replaced gi:3581799.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ357K22  Contig_ID: 01322  acc=AL022720

  COMMENT   Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://weface.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=ZK666
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone ZK666.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone ZK666 is at 1 in this sequence. The true
            right end of clone ZK666 is at 7572 in
            sequence Z48716.
            The true left end of clone F59B10 is at 30489 in this sequence. The
            true right end of clone ZK673 is at 9193 in this sequence. The
            start of this sequence (1. .101) overlaps with the end of sequence
            Z48585.
            The end of this sequence (30489. .30589) overlaps with the start of
            sequence Z48716.

            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=K09G1
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone K09G1.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone K09G1 is at 1 in this sequence. The true
            right end of clone K09G1 is at 4549 in
            sequence Z70756.
            The true left end of clone T06E4 is at 34554 in this sequence. The
            true right end of clone F25B3 is at 10833 in this sequence. The
            start of this sequence (1. .104) overlaps with the end of sequence
            Z70752.
            The end of this sequence (34554. .34657) overlaps with the start of
            sequence Z70756.

  TITLE     Direct Submission
  JOURNAL   Submitted (24-AUG-1998) Joint Genome Institute, Lawrence Livermore
            National Laboratory, 7000 East Ave., Livermore, CA 94551, USA
COMMENT     Map and sequence oriented from q centromere to telomere. Cosmid
            R30149 is separated from cosmid F21866 to the left by <1 kb. R30149
            is currently the telomeric end of this sequencing tiling path.
            Additional map and sequence information may be obtained at:
            http://www-bio.llnl.gov/bbrp/genome/genome.html.

  TITLE     Direct Submission
  JOURNAL   Submitted (29-JUL-1997)
COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University,
                  St. Louis, MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 IRQ, England
                  e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.
```

```
            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:

            The 5' cosmid is C37C3, 200 bp overlap;3' lies in a gap.  Actual
            start of this cosmid is at base position 197 of CELF40A3; actual
            end is at 41155 of CELF40A3

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

COMMENT     Overlapping Sequences:
               5': UWGC:g1940a370 (Genbank:AC002084)
               3': UWGC:g1940a142
            ----------
            Sequence Quality Assessment:
            This entry has been annotated with sequence quality
            estimates computed by the Phrap assembly program.
            All manually edited bases have been reduced to quality zero.
            Quality levels above 40 are expected to have less than
            1 error in 10,000 bp.

            Pct of Consensus above quality 40: 97.1%

            Quality  Cumulative Percentage of Consensus
            -------  ----------------------------------
                90   xxx (13.5%)
                80+  xxxxxxxxxx (47.6%)
                70+  xxxxxxxxxxxxxxx (79.9%)
                60+  xxxxxxxxxxxxxxxxx (89.6%)
                50+  xxxxxxxxxxxxxxxxxx (93.9%)
                40+  xxxxxxxxxxxxxxxxxx (97.1%)
                30+  xxxxxxxxxxxxxxxxxxx (99.5%)
                20+  xxxxxxxxxxxxxxxxxxx (99.9%)
                10+  xxxxxxxxxxxxxxxxxxx (100.0%)
                00+  xxxxxxxxxxxxxxxxxxx (100.0%)

            Base-by-base quality values are not generally visible from the
            Genbank flat file format but are available as part
            of this entry's ASN.1 file.
            ----------
            Sequence Verification:
             This sequence has been verified by Multiple Complete Digest
             Mapping. Comparison of the experimentally derived map digest
             fragments with sequence-predicted fragments is given below.
             Small fragments below a variable cutoff (approximately 400-600bp)
             are not mapped and hence do not appear in the table. There are no
             significant remaining descrepancies between the experimental and
             predicted values. Uniquely ordered fragment groups are separated
             by dashed lines.
                    EcoRI                HindIII              NsiI

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 22, constructed by the Sanger Centre chromosome 22
            mapping group.  Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr22/

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-1, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ43804, 200 bp overlap;  The
            clone sequenced to the right is DJ130H16.  Actual start of this
            clone is at base position 197 of DJ102K02.

  JOURNAL   Submitted (09-OCT-1997) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
COMMENT     Submitted by:
                    Genome Sequencing Center
                    Department of Genetics, Washington University,
                    St. Louis, MO 63108, USA
                    e-mail: rwilson@watson.wustl.edu

            MAPPING: Clones were assigned to the YAC map by hybridization by
            M. Lohdi, Cold Spring Harbor Laboratories, and fingerprinted
            by M. Marra, WashU, to pick the best candidates for sequencing.

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The actual start of this clone is at base position 1 of TM017A05; the actual end is at base position 78344 of TM017A05. The orientation of this clone is unknown.

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

LOCUS       HS454G6     79376 bp    DNA             PRI       12-FEB-1998
DEFINITION  Human DNA sequence from PAC 454G6 on chromosome 1q24. Contains
            trabecular meshwork inducible glucocorticoid response protein,
            TIGR, myocilin, ESTs and STS.
ACCESSION   Z98750
NID         g2887277
KEYWORDS    1q24; myocilin; TIGR.
SOURCE      human.
  ORGANISM  Homo sapiens
            Eukaryotae; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria;
            Primates; Catarrhini; Hominidae; Homo.

  TITLE     Direct Submission
  JOURNAL   Submitted (27-OCT-1997) sanger.ac.uk/HGP/Chr1/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Feb 14, 1998 this sequence version replaced gi:2465060.
            IMPORTANT: This sequence is not the entire insert of clone 454G6.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 1, constructed by the Sanger Centre chromosome 1
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr1/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
```

```
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 454G6 is at 1 in this sequence. The true
            left end of clone 56089 is at 79273.
            454G6 is from the library RPCI3 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

  TITLE     Direct Submission
  JOURNAL   Submitted (14-FEB-1997) E-mail enquires: humquery@sanger.ac.uk
            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Feb 17, 1997 this sequence version replaced gi:1780978.
            IMPORTANT:  This sequence is the entire insert of clone 481A17. The
            true left end of clone 481A17 is at 1 in this sequence. The true
            right end of clone 481A17 is at 107428.
```

```
            481A17 is from the library RPCI3 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong. For further
            details see http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            Clone RG335O22 is from a release of the human BAC library
            CITB-HS-A.  The library contains cloned DNA from human sperm.  See:
             Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
            Kim et al., Genomics 34:213-8 (1996).  The clone is available from
            Research Genetics, Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The actual start of this clone is at base position 1 of RG335O22;
```

```
            the actual end is at base position 108878 of RG335O22.

            This clone contains STS sWSS3514 (NID:g1222801).

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-4, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc
```

```
            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-5, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ0731H19.  The actual start of
            this clone is at base position 1 of DJ0982C16; actual end is at
            130632 of DJ0982C16.

            This clone contains STS sWSS2130 (NID:g1113390).

  TITLE     Direct Submission
  JOURNAL   Submitted (07-JAN-1998) sanger.ac.uk/HGP/ChrX/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Jan 16, 1998 this sequence version replaced gi:2467172.
            IMPORTANT: This sequence is the entire insert of clone 82J11.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome X, constructed by the Sanger Centre chromosome X
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/ChrX/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 82J11 is at 1 in this sequence. The true
            left end of clone U134E6 is at 62897.
            The true right end of clone U134E6 is at 102829.
            The true right end of clone 82J11 is at 132981.
```

82J11 is from the library RPCI1 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ U134E6 is from the Lawrence Livermore National Laboratory flow-sorted X chromosome cosmid library LLOXNC01.

COMMENT ***
*** WARNING: Phase 1 High Throughput Genome Sequence ***
***
* This sequence is unfinished. It consists of 2 contigs for
* which the order is not known; their order in this record is
* arbitrary. In some cases, the exact lengths of the gaps
* between the contigs are also unknown; these gaps are presented
* as runs of N as a convenience only. When sequencing is complete,
* the sequence data presented in this record will be replaced
*by a single finished sequence with the same accession number.

```
            *        1    38905: contig of 38905 bp in length

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                     Rice blast is one of the most devestating fungal diseases
                     of rice  world wide.  It is a filamentous ascomycete with
                     a haploid genome (n=7)  of approximately 40 Mbp.  Rice
                     blast is an important model fungal pathogen  for studying
                     numerous aspects of the fungal-host interaction.  In
                     order to facilitate genome wide analysis, a BAC library
                     containing  9216 clones with an average insert size of 130
                     kbp was constructed.  This library represents greater
                     than 25X genome coverage.  High density  colony filters
                     are available upon request."

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 639; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Human adrenal gland cysteine protease - used for diagnosing
PT   autoimmune and degenerative diseases
PS   Claim 3; Page 37; 62pp; English.
CC   A cDNA clone (T66381), designated Incyte Clone 100877, codes for a
CC   novel human cysteine protease (CP) (W15460) that is expressed in
CC   cells of the adrenal gland, and which is thought to be involved in
CC   systemic cleanup and defence.  The clone was identified via a
CC   computer search for local sequence alignments among the cDNAs of an
CC   adrenal gland library.  A modified XL-PCR procedure (see also
CC   T66404-05) was used to obtain the full-length 1855 bp cDNA sequence.
CC   A partial nucleotide sequence, Incyte Clone 66931 (T66383), was
CC   obtd. from a human umbilical vein endothelial cell cDNA library,
CC   and partial sequences (T66382, T66384-403) were also identified from
CC   several other libraries.  CP nucleic acids can be used as probes for
CC   diagnosis of conditions associated with altered CP expression,
CC   partic. autoimmune and degenerative diseases, to produce
CC   recombinant CP polypeptides, and to design antisense molecules
CC   useful in reducing expression of the genomic sequence.

PT   Repairing mutation(s) in haemoglobin by targetted mutagenesis or
PT   homologous recombination - mediated by a triplex forming
PT   oligonucleotide, opt. carrying a mutagen, partic. for treatment of
PT   sickle cell anaemia or thalassemia
PS   Claim 32; Page 41-44; 70pp; English.
CC   The human beta-globin gene (T48454) contains third-strand binding
CC   sites that can be used in targetted DNA replacement (TDR).  This
```

```
CC   method for genetic defect repair involves targetting third strands
CC   (see also T48467-70) to native DNA sequences (see also T48455-57)
CC   to induce DNA damage that stimulates homologous recombination with
CC   an introduced donor nucleic acid strand.  The method is used to
CC   correct mutations in a target region, esp. for treatment of beta-
CC   thalassaemia and sickle cell anaemia.  TDR is highly specific and,
CC   since the corrected gene is in its native chromosome, the cure is
CC   permanent.  A mutation at position 19 (thymine) of the coding
CC   sequence may also be corrected by targetted mutagenesis, in which
CC   highly specific damage to the thymine by psoralen-bound third
CC   strands (see also T48460-66) is preferentially 'misrepaired' to
CC   adenine, thereby changing HbS to normal HbA.

PT   Expression augmenting sequence elements - used in vectors for
PT   expressing recombinant proteins at high levels in shorter periods of
PT   time
PS   Claim 1; Page 23-30; 36pp; English.
CC   A 14507 bp DNA sequence (T73568) comprises a novel transcription
CC   regulatory element, expression augmenting sequence element (EASE),
CC   that facilitates high expression of recombinant proteins in
CC   mammalian host cells.  It was identified by cloning the integration
CC   site of a unique expression cassette encoding recombinant dimeric
CC   tumour necrosis factor receptor-immunoglobulin Fc fusion protein
CC   from genomic DNA of a CHO 2A5-3 cell line expressing this protein
CC   at a high level.  Expression vectors incorporating an EASE show
CC   a 2- to 8-fold improvement of recombinant protein expression levels
CC   in CHO host cells.  The EASE sequence also facilitates high
CC   expression in shorter periods of time.

PT   Prodn of cDNA library for related proteins - by screening total cell
PT   mRNA with RNA-binding protein Hel-N1 or Hel-N2
PS   Disclosure; Fig 11; 66pp; English.
CC   The sequences given in T39427-46 represent random oligonucleotides
CC   which were isolated due to their ability to bind to the human neuron-
CC   specific protein, Hel-N2.  These sequences contain short stretches
CC   of uridylate residues interspersed with other residues.  These U-
CC   rich regions share homology with the 3'-UTR instability sequences
CC   that are found in mRNA's.  Instability sequences are target elements
CC   which reside in the 3'-non-coding regions of mRNA's which encode
CC   oncoproteins and lymphokines.  Hel-N2 is a deleted form of Hel-N1
CC   in which the residues 239-251 have been deleted.  This protein is
CC   expressed in medulloblastoma tumour cells and is not found in whole
CC   human brain.  A small amount of Hel-N2 is also found in fetal brain,
CC   which may indicate a correlation with rapid growth.  Hel-N1 cDNA was
CC   isolated by probing for rat and human elav counterparts using degenerate
CC   primers designed to simulate the RNP-1 octamer sequence present in two
CC   of the three RNA recognition motifs (RRM's) of Drosophila elav.  Hel-N1
CC   was found to contain 3 RRM's, where the third one (see also W00244) is
CC   sufficient for mRNA 3'-UTR binding activity.  Full length Hel-N1, when
CC   transfected into a cell, causes cellular growth to cease, however, if
CC   just the third binding domain is transfected into cells, the cells
CC   undergo rapid growth.  Hel-N1 binds as a multimer along the mRNA,
CC   presumably enhancing its localisation, instability and/or regulating it
CC   translatability and/or deadenylating it.  This protein may be
CC   responsible for the growth cessation of neurons. Hel-N1 is an autoimmune
CC   protein in certain patients who show central nervous system
CC   manifestations of cancer called paraneoplastic cerebellar degeneration
CC   (PCD), paraneoplastic encephalomyelitis (PE) or paraneoplastic sensory
CC   neuropathy (PSN).

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 548; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Human cystatin F polypeptide - useful for e.g. treating patients
PT   requiring cystatin F, for diagnosis of neoplasia and screening of
PT   inhibitory compounds
PS   Claim 8; Pages 60-61; 77pp; English.
CC   This DNA encodes a mature human cystatin F polypeptide. The cystatin F
CC   polypeptide can be administered therapeutically, especially by expressing
CC   this encoding DNA in vivo, to treat patients requiring cystatin F. They
CC   are useful in the treatment or prevention of bacterial infection, viral
CC   infection and eye inflammation, and in eye remodelling and treatment of
CC   immunological disorders. They can be used to identify compounds which
CC   inhibit or activate cystatin F activity or bind cystatin F. Inhibitory
CC   compounds can be administered to patients requiring cystatin F inhibition
CC   e.g. in treatment of cerebral haemorrhages, encephalopathy and tumours
CC   and to inhibit HIV infection. The polynucleotides can be used to diagnose
CC   diseases involving cystatin F under-expression, by detecting
```

```
CC   polynucleotide mutations and as hybridisation probes to isolate genes
CC   with high sequence similarity. The polypeptides can be used in assays to
CC   diagnose polypeptide levels in samples and to generate antibodies. They
CC   are useful in detection of hereditary cystatin C amyloidosis angiopathy
CC   and neoplasia.

PT   Human cystatin F and related DNA - used for the diagnosis and
PT   treatment of disease in which cystatin F activation is beneficial,
PT   e.g. cancer
PS   Claim 1; Pages 62-63; 79pp; English.
CC   This sequence encodes the protein cystatin F. The sequence contains
CC   an open reading frame of 145 codons which encodes the protein.
CC   Cystatin F polypeptides have been found to display a variety of
CC   functions including influencing the intra- and extracellular catabolism
CC   of proteins and peptides, regulating proteolytic processing of
CC   pro-hormones and pro-enzymes, protecting against penetration of normal
CC   tissues by malignant cells or microorganisms and modulating local
CC   inflammatory processes in rheumatoid arthritis and purulent
CC   brochiestasis. Cystatin F and its agonists can be used for the
CC   treatment and diagnosis of diseases related to under-expression of
```

```
CC   cystatin F such as specific cancer states. Inhibitors of cystatin F have
CC   the opposite effect and can be used to treat conditions where cystatin F
CC   inhibition is beneficial.

PT   New HT6 gene DNA encoding T-cell differentiation marker - is used
PT   to produce allelic variants, derived protein etc. for diagnosing
PT   e.g. predisposition to diabetes and other auto-immune diseases
PS   Claim 1; Page 7; 12pp; German.
CC   HT6 DNA (Q48942) was obtained by PCR using the primers given in
CC   Q48945-Q48950.  Fragments (bases 1-271 and 272-690 or the entire
CC   sequence) are used as probes (claim 6-7).
CC   HT6 DNA, or its fragments, are used to detect allelic variants
CC   (which can then be cloned, identified and isolated).  HT6 may be
CC   produced by recombinant DNA methods.  HT6 DNA is used in analysis of
CC   HT6 expression defects in cases of autoimmune diseases and to identify
CC   a particular subset of T-lymphocytes.  HT6 is a T-cell differentiation
CC   marker and its expression can serve to diagnose predisposition to
CC   insulin-dependent diabetes or other autoimmune diseases.

PT   Growth hormone-like glyco-protein - isolated from pituitary gland
PT   of fish of order Pleuronectina, family Paralichthydae, partic.
PT   flounder.
```

```
PS   Claim 9; Fig 4; 29pp; English.
CC   The gene encodes a growth hormone-like protein which is found in
CC   the pituitary gland of flounders. The cDNA sequence was determined
CC   by forming deletion mutants with restriction enzymes and if no
CC   restriction enzyme site is found, by synthesising primers. Using
CC   transformante large amts. of the growth hormone like protein can
CC   be obtd. The protein can be used for growth promotion in animals,
CC   esp. fish. See also Q13300.

PT   Nucleic acid encoding trichosanthin protein - which can be used
PT   to inactivate ribosome(s) to inhibit protein synthesis or to
PT   inhibit HIV expression
PS   Claim 1; Column 3; 53pp; English.
CC   Trichosanthin protein was isolated from T.kirilowii root tuber and
CC   sequenced. The amino acid sequence was used to design sets of
CC   degenerate primers (see Q26506-8) for PCR amplification of the TCS
CC   coding sequence. The amplified product was used as a probe to
CC   isolate TCS coding sequence from T.kirilowii genomic libraries. One
CC   clone (pQ21D) contained a 4kb insert. The amino acid sequence deduced
CC   from the pQ21D insert differed from the purified TCS sequence at
CC   amino acids 211 and 224. The substitutions at each position were
CC   conservative and are postulated to indicate minor variations between
CC   strains; the purified TCS was obtained from the Canton region of
CC   China and the genomic DNA was obtained from T.kirilowii leaves from
CC   Korea. The claimed nucleic acid encodes at least the mature TCS and
CC   may further include the regions coding for the N- and C-terminal
CC   amino acid extensions or encodes TCS fused to a ligand peptide
CC   which confers cell-surface recognition properties on the fused
CC   protein. See also Q26500-Q26505.

PT   Plant Group 2 promoter sequence isolated from pepper plants  - used
PT   to prepare expression cassettes for transformation of e.g. pepper,
PT   tomato and tobacco plants.
PS   Claim 1; Page 57-58; 76pp; English.
CC   This sequence represents the constitutive pepper Group 2 (Gp2)
CC   promoter sequence up to the ATG start codon.  It is useful in the
CC   production of transgenic plants, preferably pepper, tomato and
CC   tobacco.  Desired phenotypes can be conferred to plants by
CC   transformation of the plant cells with a DNA construct containing
CC   heterologous DNA operably linked to a Gp2 promoter.  The
CC   constitutive promoter may be used for expression of the mutant
CC   acetolactate-synthase selectable marker gene, which confers
CC   chlorsulfuron-resistance.  When introduced into plant cells and
CC   constitutively expressed, it confers a phenotype that is useful in
CC   the production of transgenic plants.  A variety of genes capable of
CC   altering a plant phenotype can also be constitutively expressed,
```

```
CC   e.g. genes for herbicide resistance, fungal disease-resistance (e.g
CC   chitinases and glucanases), bacterial disease-resistance (e.g.
CC   cecropins), and insect resistance (e.g. Bacillus thuringiensis
CC   toxin).  DNA constructs containing a Gp2 promoter linked to
CC   heterologous DNA can be introduced directly into the DNA of the
CC   plant cell using techniques such as electroporation and
CC   microinjection of plant cell protoplasts.  Alternatively, the DNA
CC   constructs can be introduced directly to plant tissues using
CC   biolistic methods, such as DNA particle bombardment.  In addition,
CC   the DNA constructs may be combined with suitable T-DNA flanking
CC   regions and introduced into a conventional Agrobacterium
CC   tumefaciens host vector.

PT   Identifying cpds. antibiotic against microorganisms with
PT   enterobactin-type siderophore - by screening using host cells
PT   transformed with a siderophore gene for growth in a low iron medium
PS   Claim 1; Columns 9-12; 19pp; English.
CC   The present sequence is the Bacillus subtilis derived pENTA22 spf
CC   gene, which encodes an enterobactin type siderophore (ETS) protein
CC   prod., i.e. a ferric ion specific carrier mol.. A host cell
```

```
CC   transformed with the gene can be used to identify cpds. having
CC   potential antibiotic activity against microorganisms with an ETS
CC   mechanism, partic. Gram-positive microorganisms.
CC   The host cell is contacted with the cpd. to be tested, and the
CC   presence or absence of an effect on the host cell's ability to
CC   grow in low iron medium observed, where cpds. that inhibit the
CC   cell's ability to grow in low iron medium are identified as
CC   potential antibiotics.
CC   The pENTA22 spf gene was obtd. by screening B. subtilis chromosomal
CC   DNA for the ability to complement E. coli ent(-) mutants deficient
CC   in different enterobactin biosynthetic enzymes.

PT   DNA encoding an interleukin-15 receptor - used to ameliorate undesired
PT   effects of interleukin-15, e.g. to prevent or treat graft rejection
PS   Example 3; Page 41-42; 53pp; English.
CC   The present sequence is the cDNA insert of a second clone isolated from
CC   an A172 library. The clone exhibits an incomplet 5' region which begins
CC   at the equivalent of nucleotide 355 of T15995, and an in-frame insertion
CC   downstream of the transmembrane region that results in a different
CC   cytoplasmic tail coding domain.  A hybrid construct encoding the 5' half
CC   of W5 fused to A133 to give the alternate cytoplasmic tail (R90846) was
CC   prepared and expressed.  Cell surface binding experiments using radio-
CC   labeled human IL-15 showed that this hybrid construct encoded a
CC   polypeptide that bound IL-15. The IL-15R DNA is a multi-exon gene. IL-15R
CC   variants can be attributed to different mRNA splicing events following
CC   transcription or from proteolytic cleavage of the IL-15R protein, where
CC   the IL-15R binding property is retained. The IL-15R protein is useful in
CC   treatment of undesired effects of interleukin-15, e.g. to prevent or
CC   treat graft rejection.

PT   DNA encoding an interleukin-15 receptor - used to ameliorate undesired
PT   effects of interleukin-15, e.g. to prevent or treat graft rejection
PS   Claim 1; Page 23-34; 53pp; English.
CC   The cDNA shows a human open reading frame (ORF) encoding interleukin-15
CC   receptor (IL-15R) (see R91594), isolated from clone W5. It was isolated
CC   by cross-species hybridisation with the murine IL-15R cDNA (T15757). The
CC   mammalian IL-15R is encoded by a multi-exon gene. IL-15R variants can be
CC   attributed to different mRNA splicing events following transcription or
CC   from proteolytic cleavage of the IL-15R protein, where the IL-15R binding
CC   property is retained. The IL-15R protein is useful in treatment of
CC   undesired effects of interleukin-15, e.g. to prevent or treat graft
CC   rejection.

PT   DNA encoding an interleukin-15 receptor - used to ameliorate undesired
PT   effects of interleukin-15, e.g. to prevent or treat graft rejection
PS   Example 3; Page 35-37; 53pp; English.
CC   A lambda-gt10 library from human peripheral blood lymphocytes, was
CC   screened for the presence of a full-length clone encoding human
CC   interleukin-15 receptor (IL-15R) using a random prime labeled human
CC   IL-15R cDNA probe consisting of the entier W5 cDNA clone (T99999)
CC   without the polyA tail.  The resulting cDNA insert from this clone
CC   T15758 encodes R90843, and exhibited an in-frame insertion of 153 bp
CC   at the mature N-terminus (amino acids 24 through 74), an in-frame
CC   deletion of 99 bp downstream of the mature N-terminus that deleted
CC   nucleotides 236 to 334 of T15995, and also contained additional 5'
CC   sequence as compared to clone W5 (amino acids 1 through 10), but still
CC   did not contain an initiator methionine. The IL-15R DNA is a multi-exon
CC   gene. IL-15R variants can be attributed to different mRNA splicing events
CC   following transcription or from proteolytic cleavage of the IL-15R
CC   protein, where the IL-15R binding property is retained. The IL-15R
CC   protein is useful in treatment of undesired effects of interleukin-15,

PT   New adenovirus E1A associated protein BS69 - useful for inhibiting
PT   trans:activation, e.g. as antiviral agent and for gene therapy of
PT   tumours.
PS   Claim 5; Page 33-36; 49pp; English.
CC   T51715 encodes the adenovirus E1A-associated protein BS69. BS69 can
CC   bind to early region 1A (E1A) proteins 243R and 289R to inhibit the
CC   transactivation activity of 289R. In doing so the peptide also inhibits
CC   viral replication and is therefore useful as an anti-adenoviral agent.
CC   Vectors encoding the BS69 protein are also used in vivo for gene
CC   therapy (e.g. to treat uncontrolled proliferation of tumour cells).

PT   Introducing heterologous DNA into Prevotella ruminicola - by
PT   conjugal transfer of a shuttle vector comprising the heterologous
PT   DNA operatively linked to a promoter functional in P. ruminicola
PS   Claim 19; Page 55; 85pp; English.
CC   This sequence represents the Bacteroides Tcr gene, originally
CC   derived from the Bacteroides conjugal element TcrEmr-DOT.
CC   [Shoemaker et al., J. Bacteriol., 171:1294-1302 (1989)]. This was
CC   subcloned on a 2.7kbp fragment, and the whole of this fragment then
CC   sequenced. The gene codes for a protein of the ribosome protection
CC   type of tetracycline resistance. However, the amino acid sequence
CC   coded for by the cloned gene was found to be only about 40%
CC   identical to sequences coded for by the TetM and TetO genes. It was
CC   therefore concluded that the bacteroides Tcr gene was clearly in a
CC   separate DNA-DNA hybridisation class from TetM and TetO, and the
CC   new class of tetracycline resistance genes designated TetQ.

PT   Prodn. of plant seed protein genes - by incorporation of codon(s)
PT   for relevant limiting amino acids, e.g. for methionine in
PT   leguminous protein legumin
PS   Example; pp6-9; 12pp; German.
CC   The patent claims a method for the prodn. of nutrition-
CC   physiologically improved plant-seed proteins. Suitable plant seed
CC   protein genes are the genes for legumin or vicilin from field beans,
CC   or corresponding suitable genes for seed proteins of cereals.

PT   Plant endo-xylo:glucan transferase promoters - allowing expression
PT   of plant genes at appropriate times to influence plant morphology
PS   Claim 9; Pages 129-131; 206pp; Japanese.
CC   The present sequence is an adzuki bean (Phaseolus angularis,
CC   given as Vigna angularis in the specification) promoter gene,
CC   which induces the expression of a plant cell wall xyloglucan
CC   reconstitution enzyme, specifically endo-xyloglucan
CC   transferase 2 (EXT2). The promoter gene can be incorporated into
CC   transgenic plants to alter function, e.g. to express particular
CC   proteins or increase plant yield, or change the plant morphology.

PT   New recombinant protein with endo chitinase activity - also DNA
PT   encoding it and plants which express it, resistant to fungi,
PT   insects, bacteria and nematodes.
PS   Example; Fig 2; 82pp; French.
CC   The inventors claim a new recombinant gene which codes for a protein
CC   with encochitinase activity, or its precursor (see Q21007).  The
CC   coding part of the gene contains at least the 5' part of DNA for
CC   tomato endochitinase and at least the 3' part of DNA for the tobacco
CC   enzyme (DNA can be genomic or cDNA, but at least one intron is pref.
CC   present).  The recombinant gene includes the 35S promoter of
CC   cauliflower mosaic virus plus the terminator from the nopaline
CC   synthase gene of Agrobacterium tumefaciens.

PT   Recombinant INSV DNA constructs comprising INSV DNA coding for
PT   transcription into INSV RNA sequences - are used to transform
PT   plants to reduce susceptibility to INSV infection
PS   Claim 2; Page 16-17; 64pp; English.
CC   INSV RNA was purified from systemically infected Nicotiana rustica
CC   leaves. The short (S) transcript comprises two genes, one coding for
CC   a non-structural protein and the other (on the complementary strand)
CC   coding for the nucleocapsid protein. The 5'- and 3'-terminal
CC   sequences of the S RNA are capable of hybridising to each other; the
CC   double-stranded structure obtained by such hybridisation is referred
CC   to as a "pan-handle".

PT   Variant CD44-surface proteins - and cDNA sequences and antibodies
PT   for proteins, used in diagnosis and therapy of tumour metastases
PS   Disclosure; Fig 2; 12pp; German.
CC   The sequence is that of the cDNA clone p-meta-1 which represents a
CC   metastasis-specific variant of CD44 surface glycoprotein. The
CC   protein is useful in tumour and metastasis therapy, by its
CC   action as a ligand blocker. Antibodies can also be raised to the
CC   protein and these can be similarly useful when linked to cytotoxic
CC   agents. The indicated r-meta-1 clone corresponds to the
CC   extracellular region.See also Q14264.

PT   Plasmodium falciparum poly:peptide(s) and related nucleic acids -
```

```
PT   derived from the liver stage antigen-3, useful for malaria vaccine
PT   prodn. and diagnosis
PS   Claim 20; Fig 1A-E; 69pp; French.
CC   This sequence corresponds to the genomic sequence encoding a Plasmodium
CC   falciparum strain K1 pre-erythrocytic liver stage antigen-3 (LSA-3)
CC   protein (W24790).  The gene sequence was isolated by screening a
CC   P. falciparum strain T9/96 library with the serum from a missionary
CC   treated by prophylaxis (for strain T6/96 see FR9101286).  Of 20 clones
CC   isolated, clone 729S was used to screen a library generated from Thai
CC   strain K1.  One clone contained a 6.85 kb insert including the sequence
CC   presented here.  The gene organisation comprises a first exon, a short
CC   168 bp intron and a 5 kb second exon containing a 1.8 kb region encoding
CC   7 blocks of 4 amino acid repeats and a 3' hydrophobic region
CC   corresponding to a glycosyl-phosphatidylinositol membrane anchoring
CC   sequence.  The invention relates to new polypeptides of at least 10
CC   amino acids derived from the LSA-3 polypeptide with the exception of
CC   peptides W24791-4. The LSA-3 peptides can be used to raise antibodies
CC   and as vaccines for immunotherapy of malaria.

PT   Human anhidrotic ectodermal dysplasia gene - useful for research
PT   into hair growth
PS   Disclosure; Fig 3; 37pp; English.
CC   This sequence represents the complete CpG island 3 region found at locus
CC   Xq12-q13 in humans.  The sequence has been shown to contain the sequence
```

```
CC   encoding the human anhidrotic ectodermal dysplasia (EDA) gene (V05851).
CC   Deficiencies in the EDA gene are observed by translocations with a
CC   breakpoint in the CpG island 3.  The EDA gene can be used to study the
CC   dynamics of EDA gene expression during foetal development, and processes
CC   affecting normal hair growth in adults.  The EDA gene can also be used to
CC   study hair, sweat gland and tooth formation and growth, and ectodermal
CC   dysplasias.

PT   Production of fibrinogen in transgenic mammals - by introducing DNA
PT   segments into the germ line of a non-human mammal and collecting
PT   milk from female progeny.
PS   Claim 9; Page 47-55; 99pp; English.
CC   This sequence encodes the human fibrinogen B-beta chain.  Preferably
CC   nucleotides 470-8100, and more preferably nucleotides 512-8100, are
CC   operably linked to the signal peptide, preferably of the sheep beta-
CC   lactoglobulin gene (see T03855) and, together with the fibrinogen A-
CC   alpha chain sequence (see T03853) and the gamma chain sequence (see
CC   T03854), is introduced into a fertilised egg or the germ line of a
CC   non-human animal, preferably a sheep, pig, goat or cattle at a molar
```

```
CC   ratio of 0.5-1.0:0.5-1.0:0.5-1.0, respectively, for fusion protein
CC   gene expression in transgenic animal milk.  The recombinantly
CC   produced active fibrinogen is useful in human and veterinary
CC   medicine, e.g. in the formulation of surgical adhesives, which also
CC   consist of Factor-XIII, and as a coating surface for polymeric
CC   articles, such as synthetic vascular grafts.

PT   DNA encoding plant morphogenesis regulatory protein - useful to
PT   yield plants with short stems or altered inflorescence
PS   Claim 6; Pages 12-15; 17pp; Japanese.
CC   The present sequence encodes an Arabidopsis thaliana plant
CC   morphogenesis regulatory protein (MRP), which can be used to yield
CC   a plant with, e.g. short stems or altered inflorescence. The MRP
CC   acts on a plant at a specific site for a specific period, and can
CC   therefore be used to regulate extraneous gene expression in a
CC   plant. The MRP's cDNA or genomic DNA can be used to transform a
CC   plant to increase its MRP expression, and therefore control the
CC   form (particularly stem length) of the plant.

PT   Tomato vacuolar invertase gene - useful for producing transgenic
PT   plants with higher soluble solid content in fruit, giving greater
PT   commercial value
PS   Disclosure; Page 64-68; 87pp; English.
CC   In order to increase the soluble solids content of tomato fruit
CC   produced by a tomato plant, a DNA construct contg. DNA encoding an
CC   invertase is introduced.  The DNA encoding the invertase is pref.
CC   operatively linked to a promoter recognised by the plant RNA
CC   polymerase II.  The promoter may be a constitutive promoter,
CC   such as the cauliflower mosaic virus (CaMV) 35S promoter, or a
CC   developmentally regulated promoter that confers fruit specificity
CC   and appropriate temporal control on the expression of the DNA
CC   encoding invertase, e.g. a native Lycopersicon invertase promoter
CC   or the histidine decarboxylase (HDC) promoter region.
CC   If the DNA encodes an invertase that is not a vacuolar invertase,
CC   DNA encoding invertase is operatively linked to DNA that encodes
CC   vacuolar targeting sequences, and, if necessary, DNA encoding
CC   signal sequences.

PT   Screening for the possibility of testicular seminoma and other
PT   cancers - using MAGE-Xp gene primers
PS   Claim 7; Pages 22-34; 40pp; English.
CC   This is the MAGE-B cluster DNA sequence. The invention provides a novel
CC   method for screening for the possibility of a testicular seminoma,
CC   non-small cell lung carcinoma, melanoma, breast cancer, sarcoma, or
CC   leukaemia in a sample. The method comprises contacting the sample with
CC   at least one nucleic acid molecule which hybridises to mRNA corresponding
CC   to an MAGE-Xp gene, and determining hybridisation as a determination of
CC   possible presence of testicular seminoma, non-small cell lung carcinoma
CC   melanoma, breast cancer, sarcoma, or leukaemia in the sample. By assaying
CC   for the MAGE-B1 gene, or MAGE-B2 gene, both contained within this 40352
CC   base pair MAGE-B cluster DNA sequence, the presence of auch cancers in a
CC   sample can be determined. The genomic DNA that encodes the MAGE-B2 gene
CC   consists of nucleotides 3266-7979 of this MAGE-B cluster DNA sequence.
CC   The nucleic acid molecule that encodes a MAGE-B1 gene, consists of, in
CC   5' to 3' order, nucleotides 31403-31474, 33958-34062, 35057-35139, and
CC   38088-39691, nucleotides 31403-31474, 33958-34062, and 38088-39691,
CC   nucleotides 35057-35139 and 38088-39691, and nucleotides 33958-34062 and
CC   38088-39691 of this sequence. The primers specific for the MAGE-B
CC   gene can be used in a kit to amplify a MAGE-B gene.

PT   Autographa californica nuclear polyhedrosis virus complete genome
PT   sequence - useful in the prodn. of vectors for enhanced
PT   heterologous protein expression, such as interleukin(s),
PT   interferon(s) and neurotoxin(s)
PS   Disclosure; Page 90-186; 122pp; English.
CC   The complete nucleotide sequence of the genome of clone 6 of the
CC   baculovirus Autographa californica nuclear polyhedrosis virus (AcNPV)
CC   has been determined. The sequence is taken from the Genbank record
CC   L22858. The patent specification claims a polynucleotide selected from
CC   open reading frames (ORFs 13, 20, 22-26, 28-30, 32, 38, 41-46, 50-60,
CC   62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-126, 129-130,
CC   140-146, 148-150, 152 and 154 from a total of 154 ORFs identified by
CC   the patentees. See T13636-731. Expression vectors contg. the complete
CC   genomic sequence of AcNPV, with the exception that at least one non-
CC   essential ORF is disrupted or replaced are useful for the synthesis of
CC   heterologous proteins.

PT   Prepn. of recombinant fowl pox virus for e.g. expression of
PT   proteins - by inserting foreign DNA into enlarged inter-genic
PT   region so FPV TK-gene remains intact and codes for entire
PT   thymidine kinase
PS   Disclosure; Fig 18; 92pp; English.
CC   The sequences given in Q41021-25 represent mutations of the vaccinia
CC   virus (VV) P11 promoter sequence which were included in the expression
CC   plasmids of the invention.  The sequences were unclear when given in
CC   the specification and so represent the "best guess" of sequence. These
CC   plasmids further comprised multiple cloning sites (see Q41015-16), the
CC   FPV thymidine kinase (tk) gene and the tk gene intergenic region (see
CC   also Q41011-12).  These plasmids may be used to express foreign
CC   proteins which require post-translational modification eg. Factors II,
CC   V, VII, VIII, IX, X, XI, XII, XIII, proteins C and S, von Willebrand
CC   factor, plasminogen and derivatives, apolipo proteins, eg. apoAI and
CC   apoAII, and viral antigens, eg. hepatitis B- antigens and the antigens
CC   of hepatitis C and E viruses, of tick-borne encephalitis (TBE) virus,
CC   antigens of HIV, HSV and whole or partial sequences of antigens which
CC   cause pertussis, infectious bronchitis, tetanus, malaria, Marck's
CC   disease and Newcastle disease, these antigens being useful as vaccines.

  TITLE     Direct Submission
  JOURNAL   Submitted (10-MAR-1998) The Institute for Genomic Research, 9712
            Medical Center Dr., Rockville, MD 20850, USA
COMMENT     On Mar 10, 1998 this sequence version replaced gi:2924794.
            Address all correspondence to: Mark Adams The Institute for Genomic
            Research 9712 Medical Center Dr,
            Rockville, MD 20850, USA e-mail address: mdadams@tigr.org.  The bac
            location is on chromosome .   The orientation of the sequence is
            from SP6 end to T7 end. Genes were identified by a combination of
            five methods including: XGRAIL (available by anonymous ftp from
            arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan  (Chris Burge,
            http://gnomic.stanford.Edu/~chris/GENSCANW.html)searches of the
            complete sequence against a peptide database,and the Human gene
            Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html).
            Genes without pepetide homolgy having spliced EST hits are termed
            'Unknown gene product'. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).

  TITLE     Direct Submission
  JOURNAL   Submitted (24-JUL-1998) The Institute for Genomic Research, 9712
            Medical Center Dr., Rockville, MD 20850, USA
COMMENT     On Jul 24, 1998 this sequence version replaced gi:2959563.
            Address all correspondence to: Mark Adams The Institute for Genomic
            Research 9712 Medical Center Dr, Rockville, MD 20850, USA e-mail
            address: humgen@tigr.org.   The orientation of the sequence is from
            SP6 end to T7 end. Genes were identified by a combination of five
            methods including: XGRAIL (available by anonymous ftp from
            arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan  (Chris Burge,
            http://gnomic.stanford.Edu/~chris/GENSCANW.html)searches of the
            complete sequence against a peptide database,and the Human gene
            Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html).
            Genes without pepetide homolgy having spliced EST hits are termed
            'Unknown gene product'. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).

COMMENT     On Sep 25, 1998 this sequence version replaced gi:3135973.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ394I7  Contig_ID: 00703  acc=AL023585
            Length: 2083 bp Unfinished: dJ394I7  Contig_ID: 02076  acc=AL023585

                      NEIGHBORING COSMID INFORMATION:
            The 5' cosmid is C06E4, 200 bp overlap;3' end lies in a gap
            followed by the cosmid T12B3. Actual start of this cosmid is at
            base position 1 of CELF42C5; actual end is at base position 41351
            of CELF42C5.

            NOTES:
            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

COMMENT     Map and sequence oriented from p telomere to centromere.  Cosmid
            R26634 overlaps cosmid R26660 (AC005328) to the left from bases 1
            to 4,683 of this accession, and overlaps cosmid F8682 (AC005257) to
            the right from bases 41,662 to 43,514. Additional chromosome 19 map
            and sequence information may be obtained at:
            http://www-bio.llnl.gov/bbrp/genome/genome.html.

            * This sequence is unfinished. It consists of 17 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
```

```
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1     1848: contig of 1848 bp in length
            *    1849     1865: gap of unknown length
            *    1866     5003: contig of 3138 bp in length
            *    5004     5020: gap of unknown length

  TITLE     Direct Submission
  JOURNAL   Submitted (02-MAY-1998) Joint Genome Institute, Lawrence Livermore
            National Laboratory, 7000 East Ave., Livermore, CA 94551, USA
COMMENT     Map and sequence oriented from p telomere to centromere.  BAC 87m17
            (BC62940) overlaps with cosmid R27726 to the left and there is
            currently a sequence gap of approx. 7.5 kb to the right between BAC
            87m17 and cosmid R31973.  Additional chr 19 map and sequence
            information is available at:
            http://www-bio.llnl.gov/bbrp/genome/genome.html.

            * This sequence is unfinished. It consists of 5 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *      1     2805: contig of 2805 bp in length
            *   2806     2823: gap of unknown length

  MEDLINE   96059641
COMMENT     NOTES:
            The tga codon is read as Tryptophan in Mycoplasma capricolum Coding
            sequences below were putatively identified by Peer Bork using
            the program Genequiz at the EMBL.
            EMBL, Meyerhofstr.1, 69012 Heidelberg, Germany
            E-mail bork@embl-heidelberg.de
            More than 870,477 bases have been sequenced by the genomic walking
            technique and assembled into 372 non-overlapping contigs (Accession
            numbers Z33005 to Z33376) covering 214,528 base pairs. The length
            of the contigs varies from 63 base pairs to 2049 base pairs with an
            average length of 658 base pairs. The data consists of
            13,091 bases (6%) from one pass fluorescent sequencing and 201,437
            bases (94%) produced by genomic walking. Of the latter, 155,805
            bases (77%) have multiple coverage on at least one strand and
            112,621 bases (56%) are covered on both strands. There is a total
            of
            968 ambiguous nucleotide assignments in the data set (
            0.5%). We have compared 8,868 bases of our data with Mycoplasma
            capricolum sequences already stored in the public databases and
            note less than 0.7% difference between the two data sets (
            including ambiguous calls, insertions, deletions and mismatches ).

            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     On Nov 21, 1995 this sequence version replaced gi:521060.
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=ZK1058
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
```

unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
IMPORTANT: This sequence is not the entire insert of clone ZK1058. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
The true left end of clone ZK1058 is at 21854 in sequence Z49936.
The true right end of clone ZK1058 is at 219 in sequence Z35600.
The true left end of clone F37A8 is at 21942 in this sequence. The true right end of clone F13B10 is at 7902 in this sequence. The start of this sequence (1. .7902) overlaps with the end of sequence Z49936.
The end of this sequence (28767. .29101) overlaps with the start of sequence Z35600.

```
COMMENT     Submitted by:
            Genome Sequencing Center
            Department of Genetics, Washington University,
            St. Louis, MO  63110, USA, and
            Sanger Centre, Hinxton Hall
            Cambridge CB10 1RQ, England
            e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:

            The 5' cosmid is F48A9, 200 bp overlap;3' cosmid is ZC581, 2000 bp
            overlap.  Actual start of this cosmid is at base position 1 of
            CELD2092; actual end is at 10992 of CELZC581

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

  TITLE     Direct Submission
  JOURNAL   Submitted (14-MAY-1998) E-mail enquiries: humquery@sanger.ac.uk
            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On May 18, 1998 this sequence version replaced gi:2578146.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            IMPORTANT: This sequence is not the entire insert of clone 833B7.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone fF45C1 is at 86475 in this sequence. The
            true right end of clone fF24E5 is at 100 in this sequence. The
            start of this sequence overlaps with the end of sequence Z82185.
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 22, constructed by the Sanger Centre Chromosome 22
            Mapping Group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr22
            833B7 is from the human BAC library described in U-J. Kim et al.
            (1996) Genomics 34, 213-218. VECTOR: pBeloBAC11.

  TITLE     Direct Submission
  JOURNAL   Submitted (01-JUN-1998) sanger.ac.uk/HGP/Chr22/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Jun 4, 1998 this sequence version replaced gi:2578121.
            IMPORTANT: This sequence is not the entire insert of clone 510H16.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            During sequence assembly data are compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 22, constructed by the Sanger Centre chromosome 22
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr22/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 510H16 is at 1 in this sequence. The
            true left end of clone 77D12 is at 56548 in this sequence. The true
            right end of clone 77D12 is at 98164 in this sequence. The true
            left end of clone 286B10 is at 102372 in this sequence. The start
            of this sequence overlaps with the end of sequence Z99755.
            510H16 is from the library RPCI3 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

            Address all correspondence to: Mark Adams The Institute for Genomic
            Research 9712 Medical Center Dr, Rockville, MD 20850, USA e-mail
            address: mdadams@tigr.org.   The orientation of the sequence is
            from SP6 end to T7 end. Genes were identified by a combination of
            five methods including: XGRAIL (available by anonymous ftp from
            arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan (Chris Burge, http://genomic.stanford.Edu/~
            chris/GENSCANW.html)searches of the complete sequence against a
            peptide database,and the Human gene Index database at TIGR
            (http://www.tigr.org/tdb/hg i/hgi.html). Genes without pepetide
            homolgy having spliced EST hits are termed 'Unknown gene product'.
            Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
```

```
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-4, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The actual start of this clone is at base position 1 of DJ0791I21;
            actual end is at 133191 of DJ0791I21. The orientation of this clone
            is unknown.

            This clone contains STS sWSS2762 (NID:g1113569).

  TITLE     Direct Submission
  JOURNAL   Submitted (14-OCT-1997) sanger.ac.uk/HGP/Chr6/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Oct 31, 1997 this sequence version replaced gi:2226410.
            IMPORTANT: This sequence is the entire insert of clone 359N14.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 6, constructed by the Sanger Centre chromosome 6
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr6/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 359N14 is at 1 in this sequence. The
```

```
            true right end of clone 359N14 is at 136299.
            359N14 is from the library RPCI3 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            Clone RG136N17 is from the first release of the human BAC library
            CITB-978SK-B.  The library contains cloned DNA from the male
            fibroblast cell line 978SK.  See:  Shizuya et al., Proc. Natl.
            Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8
            (1996).  This clone is available from Research Genetics, Inc.
            (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ0978I12, 200 bp overlap.
```

```
            Actual start of this clone is at base position 98702 of DJ0978I12;
            actual end is at 62701 of RG136N17.

            This clone contains STS sWSS3049 (NID:g1234137).

COMMENT     IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments.

COMMENT     On Jul 18, 1996 this sequence version replaced gi:1416731.
            We are not submitting the same cDNA sequence redundantly to DDBJ
            since 1993. For the abundance information of clones with this
            sequence in this library and as well as in other 3'-directed
            libraries, see ' http://www.imcb.osaka-u.ac.jp/bodymap'.  The
            sequences of the clones represented by this GS sequences is also
            found there.

                     /organism="Oryza sativa"
                     /strain="Japonica"
                     /cultivar="Nipponbare"
                     /note="Vector: pBeloBAC11; Site_1: HindIII; Site_2:
                     HindIII; Rice is one of two most popular grains in the
                     world. Half of the world  population especially those
                     inhabiting highly populated areas of the  humid tropics
                     and subtropics, rely on rice as their primary source of
                     carbohydrate. Monocotyledonous rice is a diploid plant
                     (2n=24) with a  haploid genome equivalent of 431 Mbp
                     (Arumuganathan and Earle, 1991).  The relatively small
                     genome of rice, three times larger than that of
                     Arabidopsis, makes it suitable for genomic studies. In
                     order to  facilitate positional cloning, physical mapping
                     and genome sequencing  of rice, we have constructed a BAC
                     library from Oryza sativa, Nipponbare  variety. The
                     library contains 36,864 clones with an average insert size
                      of 128.5 Kb providing 10.9 haploid genome equivalents.
                     The deep  coverage allows the isolation a particular
                     sequence with a probability  of 99.9 %. Two high density
                     filters, each containing 18,432 clones  (doubly spotted),
                     represent the whole library for colony screening."

                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C0
                      library is a subtracted library derived from the UI-R-A1
                      and UI-R-E1 libraries. The UI-R-A1 library consisted of a
                      mixture of individually tagged normalized libraries
                      constructed from rat  placenta, adult lung, brain, liver,
                      kidney, heart, spleen, ovary,  and muscle. The UI-R-E1
                      library  consisted of a mixture of individually tagged
                      normalized libraries constructed from 8, 12 and 18-day
                      embryo. The tag is a string of 3-5 nucleotides present
                      between the Not I  site and the oligo-dT track which
                      allows identification of the library of origin of a clone
                      within the mixture. The subtracted library (UI-R-C0) was
                      constructed as follows: PCR amplified cDNA inserts from a
                      pool of UI-R-A1 and UI-R-E1 clones from which 3' ESTs had
                      been derived was used as a driver in a hybridization with
                      the pooled UI-R-A1 and UI-R-E1 library in the form of
                      single-stranded circles.  The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-C0
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

COMMENT     On Mar 25, 1998 this sequence version replaced gi:2894448.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.
            For more information about this sequence or the Malaria Project,
            see http://www.sanger.ac.uk/Projects/P_falciparum.

            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=F53B7
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            This sequence is the entire insert of clone F53B7. The true left
            end of clone C13G3 is at 35852 in this sequence. The true right end
            of clone F17C11 is at 8546 in this sequence. The start of this
            sequence (1. .104) overlaps with the end of sequence Z72507.
            The end of this sequence (35852. .35955) overlaps with the start of
            sequence Z74027.

            ***                                                          ***
            * This sequence is unfinished. It consists of 32 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *        1     4009: contig of 4009 bp in length
            *                     gap of unknown length
            *     4010     9108: contig of 5099 bp in length
            *                     gap of unknown length
            *     9109    15781: contig of 6673 bp in length
            *                     gap of unknown length
            *    15782    23960: contig of 8179 bp in length
            *                     gap of unknown length
            *    23961    28258: contig of 4298 bp in length
            *                     gap of unknown length
            *    28259    32224: contig of 3966 bp in length

COMMENT     IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ742C19  Contig_ID: 01948  acc=  Length:
            176771 bp Unfinished: dJ742C19  Contig_ID: 02029  acc=  Length:
            1044 bp.

  AUTHORS   Williamson,H.
  TITLE     Direct Submission
  JOURNAL   Submitted (12-DEC-1995) Sanger Centre, Hinxton, Cambridgeshire,
            CB10 1RQ, England. E-mail enquires regarding this sequence:
            humpub@sanger.ac.uk
COMMENT     IMPORTANT:
            This sequence is not the entire insert of clone L226F1.  It may be
            shorter because we only sequence overlapping sections once, or
            longer because we arrange for a small overlap between neighbouring
            submissions.
            The true left end of clone L226F1 is at 1 in this sequence. The
            true left end of clone L17A9 is at 8618 in this sequence. This
            sequence has been finished according to sequence map criteria as
            follows.  An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu).  Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            L226F1 is from cosmid library LA04NC01 constructed at the Human
            Genome Center, Los Alamos National Laboratory, NM 87545 under the
            auspices of the U.S. Department of Energy. The library was
            constructed using flow-sorted human chromosome 4 from a
            Hamster-Human hybrid cell line ( UV20HL21-27 ) containing human
            chromosomes 4, 8 and 21.
            VECTOR: sCos1
            L226F1 is contained in a clone contig spanning
            2Mb which is described in Baxendale et al, Nature Genetics 4 ( 1993
            ) 181- 186.  See also Myers et al, Cytogenet Cell Genet. 66 ( 1994
            ) 218-230.

  COMMENT   Map and sequence oriented from q centromere to
            telomere. Cosmid R27946 is expected to overlaps BAC 326584
            (CIT-978SK-459f4) to the left by approximately 10 kb, and is
            separated from cosmid F16593 to the right by approximately 3 kb.
            Additional map and sequence information may be obtained at:
            http://www-bio.llnl.gov/bbrp/genome/genome.html.

LOCUS       HSU52111   153460 bp    DNA             PRI       11-SEP-1997
DEFINITION  Homo sapiens Xq28 genomic DNA in the region of the ALD locus
            containing the genes for creatine transporter (SLC6A8), CDM,
            adrenoleukodystrophy (ALD), Na+-isocitrate dehydrogenase gamma
            subunit (IDH), and translocon-associated protein delta (TRAP)
            genes, complete cds, plexin related protein (PLEXR) and serine
            kinase (SK) genes, partial cds, Xq28lul gene and cytochrome C (CCp)
            pseudogene.
ACCESSION   U52111

COMMENT     Genome Sequencing Center
            Department of Genetics, Washington University
            St. Louis, MO 63108, USA
            http://genome.wustl.edu/gsc
            e-mail: sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            sections once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project and the Washington University Genome Sequencing Center.
            For additional information about the map position of this sequence,
            see http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send an E-mail to
            egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone is from a release of the human BAC library. The library
            contains cloned DNA from a human sperm.  For references see:
            Shizuya et al., Proc. Natl. Acad. Sci. 89:8794-8797 (1992); Kim et
            al., Genomics 34:213-218 (1996).
            VECTOR:  pBELO
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            Actual start of this clone is at base position 1 of H_RG326K09;
            actual end is at 158537 of H_RG326K09.  This clone lies in an
            unanchored cluster of unknown orientation.

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=C34E7
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone C34E7.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone C34E7 is at 1 in this sequence. The true
            right end of clone C34E7 is at 14303 in
            sequence Z67879.
            The true left end of clone C05E7 is at 26908 in this sequence. The
            true right end of clone K02A4 is at 6791 in this sequence. The
            start of this sequence (1. .100) overlaps with the end of sequence
            Z67883.
            The end of this sequence (26908. .27008) overlaps with the start of
            sequence Z67879.

  COMMENT   On Nov 26, 1997 this sequence version replaced gi:1752968.
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=M01B2
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone M01B2.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone M01B2 is at 1 in this sequence. The true
            left end of clone T10H4 is at 26910 in this sequence. The true
            right end of clone R10G11 is at 18127 in this sequence. The start
            of this sequence (1. .6199) overlaps with the end of sequence
            Z81047.
            The end of this sequence (26910. .27013) overlaps with the start of
            sequence Z81119.

RESULT   43
LOCUS       FRHDGENE    27470 bp    DNA             VRT       17-FEB-1997
DEFINITION  F.rubripes Huntington's disease gene homologue.
ACCESSION   X82939
NID         g790997
KETWORDS    homologue; Huntington's disease gene.
SOURCE      Fugu rubripes.
  ORGANISM  Fugu rubripes
            Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata;
            Vertebrata; Actinopterygii; Neopterygii; Teleostei; Euteleostei;
            Acanthopterygii; Percomorpha; Tetraodontiformes; Tetraodontoidei;
            Tetraodontidae; Fugu.

DEFINITION  Canine adenovirus type 1 complete genome.
ACCESSION   Y07760
NID         g1526575
```

```
KEYWORDS    inverted repeat; open reading frame.
SOURCE      Canine adenovirus type 1.
  ORGANISM  Canine adenovirus type 1
            Viruses; dsDNA viruses, no RNA stage; Adenoviridae; Mastadenovirus.
REFERENCE   1  (bases 1 to 30536)
  AUTHORS   Morrison,M.D., Onions,D.E. and Nicolson,L.
  TITLE     Complete DNA sequence of canine adenovirus type 1
  JOURNAL   J. Gen. Virol. 78 (Pt 4), 873-878 (1997)
  MEDLINE   97275900
REFERENCE   2  (bases 1 to 30536)
  AUTHORS   Morrison,M.D.
  TITLE     Direct Submission
  JOURNAL   Submitted (03-SEP-1996) M.D. Morrison, University of Glasgow Vet
            School, Department of Veterinary Pathology, Garscube Estate,
            Bearsden Road, Glasgow G61 1QH, UK
COMMENT     Related sequences; M16830, M16831, M60937, S38212, S38238 and
            U55001.

COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=T18D3
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
```

```
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone T18D3.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone T18D3 is at 1 in this sequence. The true
            right end of clone T18D3 is at 4855 in
            sequence Z68117.
            The true left end of clone F45E6 is at 32502 in this sequence. The
            true right end of clone T24D3 is at 19338 in this sequence. The
            start of this sequence (1. .100) overlaps with the end of sequence
            Z68121.
            The end of this sequence (32502. .32601) overlaps with the start of
            sequence Z68117.

COMMENT     On Nov 21, 1995 this sequence version replaced gi:463205.
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
```

```
            see:-
            http://weback.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=K08E5
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone K08E5.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone K08E5 is at 1 in this sequence. The true
            left end of clone T20G5 is at 32729 in this sequence. The true
            right end of clone ZK1128 is at 11463 in this sequence. The start
            of this sequence (1. .101) overlaps with the end of sequence Z47357.
            The end of this sequence (32729. .32828) overlaps with the start of
            sequence Z30423.

COMMENT     Submitted by:
                    Genome Sequencing Center
                    Department of Genetics, Washington University,
                    St. Louis, MO  63110, USA, and
                    Sanger Centre, Hinxton Hall
                    Cambridge CB10 1RQ, England
                    e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone
```

NEIGHBORING COSMID INFORMATION:

The 5' cosmid is 80511, 200 bp overlap. Actual start of this cosmid is at base position 38872 of CELB0511; actual end is at 33448 of CELC34B2. This cosmid lies in an unanchored cluster, the orientation of which is unknown.

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1491; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Enriched oligonucleotides and corresp. sequences - used as
PT   markers for human genes transcribed in-vivo, facilitate tagging
PT   of most human genes
PS   Example 1; Page 143; 500pp; English.
CC   The Expressed Sequence Tag was isolated from a human brain cDNA
CC   library as part of a large set of ESTs which can be used as markers
CC   for human genes transcribed in vivo. They can be used to facilitate
CC   tagging of most human genes, for mapping locations of expressed genes
CC   on chromosomes, for individual or forensic identification, for mapping
CC   locations of disease-associated genes, for identification of tissue
CC   type, and for prepn. of antisense sequences, probes and constructs.
CC   EST00165 has an "excellent" coding probability as evaluated using the
CC   coding-region prediction program CRM and hybridises to chromosome 15.
CC   See also Q59041-Q61440.

PT   Particular expressed sequence tags from human CDNA - corresponds
PT   to transcription prods. of genes, useful for tagging genes, .
PT   mapping chromosomes and tissue typing
PS   Claim 3; Page 153; 199pp; English.
CC   This sequence represents an EST (expressed sequence tag) ESTs are markers
CC   for human genes actually transcribed in vivo. Unlike the random genomic
CC   DNA sequence tagged sites (STSs), ESTs point directly to expressed genes.
CC   The use of ESTs could facilitate the tagging of most expressed human
CC   genes within a few years at a fraction of the cost of complete genomic
CC   sequencing. Using PCR primers Q39419-Q39580 (sequences designed
CC   from the ESTs) sublocalisation of an EST can be achieved with panels of
CC   fragments from specific chromosomes or pools of large genomic clones in
CC   an analogous manner. This sequence represents EST00165.

PT   New human 38 kD FK-506 binding protein and DNA encoding it -
PT   useful for identifying cpds. able to block allo:graft rejection
PT   by preventing T-cell activation
PS   Claim 2; Pages 33-34; 44pp; English.
CC   Q80319 encodes R64226 the human 38kDa FK-506 binding protein. The
CC   protein can be used to identify cpds. with immunosuppressive
CC   activity, able to block allograft rejection by preventing T-cell
CC   activation. It can also be used, opt. when immobilised, to
CC   identify, quantify and purify FK-506 and FK-506 like cpds.

PT   and cAMP, that modify, complement or suppress genetic defect and
PT   correct associated phenotypic alteration
PS   Claim 16; Page 119; 169pp; English.
CC   Plasmid pRATDPD was isolated from a rat brain cDNA library. It is
CC   thought to encode a cyclic nucleotide PDE. The RATDPD cDNA was used
CC   as a probe to isolate plasmid pPDE2RR by low stringency screens of
CC   a human temporal lobe cDNA library. The inventors have classified
CC   PDE2RR in PDE class IV4 along with TM72 (Q14631).

PT   DNA mols. isolated from human glioblastoma cells - encode
PT   RAS-related or cyclic nucleotide phosphodiesterase proteins
PS   Claim 5; Column 117-120; 101pp; English.
CC   The sequences given in T34377-84 represent plasmid fragments which
CC   were isolated by hybridisation with mammalian genes cloned by
CC   complementation.  These sequences were isolated using probes derived
CC   from the sequences given in T34366-76 which were cloned via
CC   complementation in yeast.  Plasmids pPDET, pPDE10X inv and pPDE2RR were
CC   isolated by low stringency hybridisation screens of a human temporal
CC   lobe cDNA library using the pRATPDP insert as a probe.  Comparison of
CC   the nucleotide sequences given in T34377-79 indicated that the inserts
CC   are representatives of the same genetic locus as the insert in pTM72.
CC   Plasmids pGB14 and pGB18ARR were obtained in the same manner.  DNA
CC   sequence analysis revealed that they are representatives of the same
CC   genetic locus as the inserts in pTM3 and pJC44x.  Plasmid pGB25 was also
CC   obtained at low stringency hybridisation using the pRATPDP insert as a
CC   probe.  Judged by its nucleotide and deduced amino acid sequence it
CC   represents a novel member of the phosphodiesterase family IV.  The cDNA
CC   insert of pBG25 was used as a probe to obtain pPDE18 and pPDE21.  The
CC   cDNA of pPDE18 represents the same locus as that of pGB25 and contains
```

```
CC   more sequence information than the pGB25 cDNA.  The pPDE21 insert
CC   represents a fourth member of phosphodiesterase family IV.  The
CC   assignment to family IV is based solely on sequence relationships.

PT   Phaffia derived GAPDH and carotenoid synthesis genes and promoter
PT   fragment - used in the recombinant production of therapeutically
PT   useful proteins e.g. carotenoids for use in food colouring
PS   Claim 32; Page 56-58; 118pp; English.
CC   The present sequence represents a Phaffia derived carotenoid
CC   biosynthesis pathway enzyme gene which can be used in the novel
CC   recombinant DNA of the present invention. The recombinant DNA comprises
CC   a transcription promoter operably linked to a downstream sequence to be
CC   expressed, where the transcription promoter comprises a region found
CC   upstream of the open reading frame (ORF) of a highly expressed Phaffia
CC   gene (preferably GAPDH, a ribosomal protein gene, an enzyme involved in
CC   the biosynthesis pathway). The recombinant DNA can be used to transform
CC   hosts, preferably Phaffia. These transformed hosts are then used in the
CC   recombinant production of GAPDH or an enzyme involved in carotenoid
CC   synthesis, preferably astaxanthin. They may also be used to produce a
CC   pharmaceutical product. Purified carotenoids can be used as colourants
CC   in food and/or feed, and also in cosmetics.

PT   DNA mols. isolated from human glioblastoma cells - encode
PT   RAS-related or cyclic nucleotide phosphodiesterase proteins
PS   Claim 4; Column 81-88; 101pp; English.
CC   The sequences given in T34374-76 represent plasmid fragments which
CC   contain human glioblastoma cell cDNA inserts which are capable of
CC   correcting the heat shock sensitivity of the phosphodiesterase
CC   deficient yeast strain 10DAB.  Several cDNA's were isolated and
CC   sequenced.  pTM22 encodes a novel human gene.  From computer analysis,
CC   pTM22 putatively encodes a protein homologous to various cAMP
CC   phosphodiesterases, such as the bovine Ca2+/calmodulin dependent cAMP
CC   phosphodiesterase and the rat DPD phosphodiesterase.  Sequences related
CC   to pTM22 were found to be expressed in human heart.  Plasmid pTM22 was
CC   unable to correct the heat shock sensitivity of RAS2(val19) yeast
CC   strains.  It thus appears that the pde1- and pde2- yeast strain 10DAB
CC   is more sensitive to phenotypic reversion by mammalian cAMP
CC   phosphodiesterase clones than is the RAS2(val19) yeast strain.  The
CC   inserts in the plasmids pTM3 and pTM72 were also characterised.  These
CC   two different cAMP phosphodiesterase cDNA's were found to be closely
CC   related to, but distinct from, the pRATDPD insert and the pJC99 insert.
CC   Biochemical analysis of cell lysates has established that the cDNA's of
CC   pTM3 and pTM72, pJC44x and pRATDPD encode rolipram sensitive cAMP
CC   phosphodiesterases.

PT Antibody specific for haematopoietic stem/progenitor cell antigen,
PT AC133 - useful to purify such cells, e.g. for use as gene therapy
PT vehicles or for bone marrow reconstitution
PS Claim 21; Page 42-48; 78pp; English.
CC This claimed nucleic acid molecule includes a coding region for
CC a human haematopoietic progenitor cell antigen (see W26769),
CC designated AC133 antigen. It was isolated form a WERI-Rb-1
CC retinoblastoma cDNA library by PCR amplification using primers
CC based on isolated peptides of purified AC133. Expression of AC133
CC is highly tissue specific. It is detected on a subset of
CC haematopoietic progenitor cells derived from human bone marrow,
CC foetal bone marrow and liver, cord blood and adult peripheral
CC blood. The subset of cells recognised by AC133 is CD34bright and
CC contains substantially all of the granulocyte/monocyte colony
CC forming units present in the CD34+ population. The highly specific
CC distribution of AC133 makes it useful as a reagent for isolating
CC and characterising human haematopoietic progenitor and stem cells,
CC which can be used e.g. as gene therapy vehicles or for bone marrow
CC reconstitution. Exploiting AC133 as a marker ensures a high purity
CC population, reducing the risk of tumour cell contamination of donor
CC cells. AC133 polynucleotides can be used to identify related
CC sequences, or cells/tissues expressing AC133, and to produce
CC recombinant AC133.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1007; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Amplification primers and probes for rapid detection of
PT   Staphylococcus  - resistant to quinolone antibiotics in clinical
PT   samples
PS   Claim 5; Page 16; 22pp; German.
CC   The gyrase A sequences (nucleotides 2394-2658) of ca. 50
CC   quinolone resistant S. aureus isolates were analysed.
CC   Seven variant sequences were found (T12306-T12312). 4 types of
CC   mutations were identified: TCA to TTA; ATT to ATC; GAA to AAA
CC   and TCA to GCA.  The 5th mutation (GAC to GAT) does not result
CC   in an amino acid substitution. Amplification primers
CC   (T12300-T12303) and probes (T12304 and T12305) have been produced
CC   for the rapid detection of the above mutations.
CC   Primer 1 and 4 detect the C/T mutation at position 2533.
CC   Primer 2 and 4 detect the T/G mutation at position 2532.
CC   Primer 3 and 4 detect the G/A mutation at position 2544.

PT   Vaccine against avian coccidiosis - comprising recombinant
PT   Eimeria antigen ac-1b or ac-6b gene, or microorganisms expressing
PT   them
PS   Claim 1; Page 39 + Fig 1; 56pp; English.
CC   To identify antigens of E. acervulina, expression libraries were
CC   prepd. in lambda vector, lambda gt11, using cDNA prepd. from polyA
CC   mRNA isolated from E. acervulina oocysts.  The cDNA expression
CC   library was screened with monoclonal antibody (MAb) 12-09 which was
CC   raised against the sporozoite stage of E. acervulina.  The library
CC   to be screened was plated on a host that allows lysis and plaque
CC   formation.  During induction of the antigens encoded by the phage,
CC   the plaques were identified by screening the filters with MAb 12-09.
CC   The cDNA inserts from the MAb 12-09 positive phage were cloned into
CC   bacteriophage M13 and subjected to sequence analysis.  Following
CC   sequence analysis, E. acervulina antigen ac-1b was identified.

PT   Polypeptide mimic of native apo B-100 and native apo A-I - useful
PT   in assays for LDL and HDL in plasma samples
PS   Claim 10; Pages 103-104; 137pp; English.
CC   The inventors claim a portion of the polypeptide contg. apo B-100
CC   that immunoreacts with antibodies secreted by the hybridoma MB47
CC   having ATCC Accession No. 8746.  Polypeptides specifically claimed
CC   include residues 217-297, 216-310, 216-331, 216-352, 216-377, 1-377,
CC   205-297, 173-297, 140-297.  DNA sequences encoding the polypeptides
CC   are also claimed.  Also claimed are a fusion polypolypeptide that
CC   contains: (a) a first amino acid residue sequence up to 250 residues
CC   in length that includes residues 120-135 of apo A-I, (b) a second
CC   amino acid residue sequence up to 375 residues in length that
CC   includes residues 217-297 of apo B-100 and DNA encoding it.

PT   Prodn. of heterologous protein in bacterial host cells -
PT   exported into the culture medium as fusion protein with
PT   flagellin protein native to host.
PS   Disclosure; 4pp; English.
CC   By ligating the flagellin coding sequence to a protein required to be
CC   secreted into the medium, the product can be collected. If a linker
CC   encoding selectively cleavable peptide is used in ligation, the flagellin
CC   portion may be cleaved from the product.

PT   Heterologous protein prodn. in bacterial host cell - using
PT   nucleotide sequence encoding at least N-terminal portion of
```

```
PT   flagellin protein
PS   Disclosure; Table 1, p10A; 42pp; English.
CC   The DNA sequence encoding the N-terminal portion of flagellin, e.g.
CC   a portion of the hag gene of B. subtilis, is operatively linked to
CC   an expression control sequence. The flagellin gene is linked via its
CC   3' terminus to the 5' terminus of a heterologous protein via a
CC   linking nucleotide sequence which encodes a selectably cleavable
CC   polypeptide such that the exported protein contains a selectably
CC   cleavable site. Proteins which may be produced include hormones.

PT   Characterisation of unknown organism - by determn. of
PT   evolutionarily conserved sequences in genetic material relative
PT   to other organisms
PS   Example; Page 97-99; 130pp; English.
CC   The inventors claim a method for the characterisation of an unknown
CC   organism by determn. of evolutionarily conserved sequences in
CC   genetic material relative to other organisms.  The method permits
CC   rapid, reliable and accurate characterisation and identification of
CC   organisms, including prokaryotic and eukaryotic organisms, such as
CC   bacteria, plants and animals. For example, the alpha-fetoprotein
CC   (AFP) gene was used as a probe to distinguish humans from rats
CC   on the basis of RFLP following digestion with endonuclease MnlI.
CC   It was calculated that fragments of 24, 34, 104 and 108 bps
CC   describe human DNA, whilst fragments of 24, 59, 90 and 145
CC   bps describe rat DNA. Whilst both sequences contain the 24bp
CC   fragment, it is the set of fragments (taxonomic characters)
```

```
CC   that is of significance.

PT   Determination of the complementation group of tumour cells - by
PT   determining intracellular mortalin distribution
PS   Example 1; Fig 1; 18pp; English.
CC   This sequence encodes murine mortalin protein.  Mortalin is found in
CC   mouse embryonic fibroblasts.  It has significant homology to heat shock
CC   proteins but is not heat shock inducible.  The amino and carboxy termini
CC   of mortalin differ significantly from other heat shock family members.
CC   The invention concerns a method for determining the complementation group
CC   of an immortalised cell.  The method comprises: (a) determining the
CC   intracellular distribution of a mortalin in the cell; and (b) correlating
CC   the determined distribution with the mortalin distribution in cells of
CC   complementation group A, B, C or D.  The capacity to readily determine
CC   the complementation group of a tumour cell would provide a valuable
CC   means for assessing the severity of the disease and determining the
CC   aggressiveness needed to treat the cancer. A sensitive means for
CC   discerning tumour cells in microtumours, or for determining if a
CC   tumour contains different classes of tumour cells would assist in
CC   the diagnosis and treatment of cancer.

PT   Pancreatic islet cell antigens obtd. by mol. cloning - used in
PT   research, diagnosis and treatment of insulin-dependent (Type I)
PT   diabetes mellitus.
PS   Disclosure; Fig 18; 45pp; English.
CC   A cDNA library was constructed from RNA extracted from purified
CC   human islets of Langerhans cells. The library was screened with
CC   sera from autoimmune patients with Type I diabetes mellitus.
CC   ICA 525 is one of nine clones found to react predominantly with
CC   diabetic sera. The protein expressed by the clone was analysed by
CC   expressing the clones in E.coli hosts. The protein or peptide
CC   fragments of it can be used as immunoassay reagents in the
CC   presymptomatic diagnosis of insulin-dependent diabetes mellitus
CC   (IDDM).
CC   They may also be used to identify or mark T- or B-cells involved in
CC   IDDM or to bind or block these same cells for therapy.

PT   Human and mouse type C lectin(s) - useful as competitive inhibitor
PT   of lectin activity and as molecular markers for tissues that express
PT   them
PS   Example 1; Page 39-42; 97pp; English.
CC   The present sequence encodes a novel type C lectin. Type C lectins
CC   can be used to identify and purify their native ligands and compete
CC   with them for their binding, especially useful as competitive
CC   inhibitors of the biological activity of native type C lectins.
CC   This makes type C lectins useful as molecular markers for tissues
CC   in which they are expressed. The nucleic acid, encoding type C lectin,
CC   can be used to identify other type C lectin coding sequences.

PT   Integrin alpha sub-unit cytoplasmic domain polypeptide(s) - used
PT   for prodn. of antibodies and in detection of integrin sub-units
PT   in body samples
PS   Disclosure; Page 83-87; 115pp; English.
CC   The sequences given in Q31188-89 encode the human alpha 6A and 6B
CC   integrin subunits.  Integrins are a family of cell surface receptors
CC   which serve cellular adhesion functions.  These receptors form a link
CC   between the extracellular matrix and the cytoskeleton through their
CC   binding to various extracellular components.  Each integrin receptor
CC   is a heterodimer comprised of an alpha and a beta subunit.  Each alpha
CC   subunit tends to associate with only one type of beta subunit but
CC   there are several exceptions to this rule.  These integrins correspond
CC   to the laminin receptor. The cytoplasmic domain of the 6A and 6B
CC   integrins differs from previously isolated alpha 6 integrins.

PT   Cloned DNA sequence encoding plasmodium falciparum protein -
PT   useful for expressing the protein for use in vaccines against
PT   malaria
PS   Claim 2; Fig 1; 51pp; English.
CC   The sequence encoding the P195  protein of Plasmodium falciparum
CC   (N50530) and a peptide comprising at least one of its epitopes
CC   (see P50777) are claimed. Also claimed is a vaccine for inducing
CC   immunity to malaria comprising the novel peptide or P195 or a
CC   peptide comprising at least one epitope when derived from the new
CC   DNA sequence, together with a carrier.

PT   Kit for automated genotyping contg. pairs of PCR primers - designed
PT   to amplify polymorphic nucleotide repeat sequences, arranged in sets
PT   each with a characteristic fluorescence label, useful e.g. in
PT   detection of disease related genetic rearrangement
PS   Disclosure; Fig 7L-3; 104pp; English.
CC   The method aims to provide a collection of highly reproducible
CC   microsatellite marker sequences (MMS) at approx. 10-50 cM intervals
CC   throughout the human genome which can be detectably labelled. The
CC   MMS are polymorphic, simple sequence repeats and can be used in
CC   automated genotyping. esp. fluorescence-based. The primers correspond
CC   to the unique DNA sequence surrounding each marker, and PCR is used to
CC   detect each polymorphism. When the MMS show considerable polymorphism
CC   (ie. a difference in the number of repeats) between individuals, the
CC   markers can be particularly informative. The MMS can be ideal for
CC   linkage studies. Kits comprise at least 4 groups, of at least 3 sets,
CC   each comprising labelled primers for PCR amplification of the DNA.
CC   Group 12 primer pairs are shown in Q95883-914. The published size range
CC   of the D16S451 allele is 208-234 bp, and the degree of heterozygosity
CC   in the population is about 72%.

PT   Genes encoding insecticidal proteins of Bacillus thuringiensis -
PT   modified to enhance expression in monocotyledonous plants
PS   Example 1; Column 17; 86pp; English.
CC   The present sequence represents an oligonucleotide used in the present
CC   invention describing new structural genes capable of being expressed in
CC   a monocotyledonous plant. The new genes comprise modified nucleotide
CC   sequences which encode insecticidal proteins of Bacillus thuringiensis.
CC   The genes have been modified to reduce the usage of codons that are
CC   rare or semi-rare in monocotyledon DNA, thereby increasing
CC   transformation efficiency and/or increasing accumulation of the
CC   insecticidal protein in monocotyledon tissues.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 909; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PS   Claim 26; Page 24; 51pp; English.
CC   Q95197 is a simple tandem repeat (STR) corresponding to wg1g9. The
CC   STR can be used for treatment and diagnosis in human and veterinary
CC   medicine, partic. for genetic characterisation, mapping, linkage
CC   studies and analysis/diagnosis of acquired disease alleles.

PT   Enriched oligonucleotides and corresp. sequences - used as
PT   markers for human genes transcribed in-vivo, facilitate tagging
PT   of most human genes
PS   Example 4; Page 225; 500pp; English.
CC   The Expressed Sequence Tag was isolated from a human brain cDNA
CC   library as part of a large set of ESTs which can be used as markers
CC   for human genes transcribed in vivo. They can be used to facilitate
CC   tagging of most human genes, for mapping locations of expressed genes
CC   on chromosomes, for individual or forensic identification, for mapping
CC   locations of disease-associated genes, for identification of tissue
CC   type, and for prepn. of antisense sequences, probes and constructs.
CC   EST01523 has a "poor" coding probability as evaluated using the
CC   coding-region prediction program CRM. See also Q59041-Q61440.

PT   Particular expressed sequence tags from human CDNA - corresponds
PT   to transcription prods. of genes, useful for tagging genes,
PT   mapping chromosomes and tissue typing
PS   Claim 3; Page 149; 199pp; English.
CC   This sequence represents an EST (expressed sequence tag) ESTs are markers
CC   for human genes actually transcribed in vivo. Unlike the random genomic
CC   DNA sequence tagged sites (STSs), ESTs point directly to expressed genes.
CC   The use of ESTs could facilitate the tagging of most expressed human
CC   genes within a few years at a fraction of the cost of complete genomic
CC   sequencing. Using PCR primers Q39419-Q39580 (sequences designed
CC   from the ESTs) sublocalisation of an EST can be achieved with panels of
CC   fragments from specific chromosomes or pools of large genomic clones in
CC   an analogous manner. This sequence represents EST00154.

PT   Variable regions of b-chain of T-lymphocyte receptors and their
PT   DNA - useful as immuno:modulant(s) and for diagnosing immune
PT   disorders
PS   Claim 1; Page 50; 75pp; French.
CC   RNA was isolated from peripheral lymphocytes and converted to cDNA
CC   using a C-beta-specific primer. The cDNA was amplified by anchored
CC   PCR using C-beta and polyC primers, then amplified again using a
CC   different C-beta specific primer. The amplified product was SacII-
CC   restricted, inserted into Bluescript SK+ vector and used to transform
CC   E.coli XL-1blue. Transformants were screened with a C-beta specific
CC   probe and DNA from positive clones was sequenced in the C-beta
CC   region. The sequence designated "IGR b 16" is a consensus sequence;
CC   a C has been observed in stead of a T in position 231 and an A has
CC   been observed at position 259, in stead of a G. IGR b16 has a
CC   homology of 94% with clone HBVP34, a previously identified member
CC   of the V beta 13 subfamily.
CC   See Q28173-Q28228.

            WARNING: There is evidence that suggests that the 384-well parent
            plate of this clone contains both human and mouse derived clones.
            Thus, the origin of this clone is uncertain. This caution should be
            kept in mind should you use this clone.

              vector=pBlueScript SK(+) host=E. coli XL1-Blue primer=T7 Genomic
              DNA, from asynchronous blood stage parasites of the cloned Honduran
              HB3 isolate cultured in vitro, was digested with mung bean nuclease
              in the presence of 30% formamide at 50oC (Vernick, K.D., Imberski,
              R.B., and McCutchan, T.F. 1988. Nucleic Acids Research
              16:6883-6896).  The ends of the fragments were polished using T4
              DNA polymerase, and the fragments were ligated to EcoR V-cleaved
              and dephosphorylated pBlueScript SK(+).  Recombinant plasmids
              transformed E. coli XL1-Blue.

              WARNING: There is evidence that suggests that the 384-well parent
              plate of this clone contains both human and mouse derived clones.
              Thus, the origin of this clone is uncertain. This caution should be
              kept in mind should you use this clone.

              This clone is available royalty-free through LLNL ; contact the
              IMAGE Consortium (info@image.llnl.gov) for further information.

            WARNING: There is evidence that suggests that the 384-well parent
            plate of this clone contains both human and mouse derived clones.
            Thus, the origin of this clone is uncertain. This caution should be
            kept in mind should you use this clone.

            This clone is available royalty-free through LLNL ; contact the
            IMAGE Consortium (info@image.llnl.gov) for further information.

SOURCE      human clone=238910 primer=Promega -21m13 library=Weizmann Olfactory
            Epithelium vector=pBluescript SK- host=SOLR cells (kanamycin
            resistant) Reite1=EcoRI Reite2=XhoI From 35 year old female. The
            cDNA was oligo (dT) primed with an XhoI restriction  enzyme
            recognition site and an 18 base poly dT sequence.   For the 5' end,
            the synthesized cDNA termini were treated with T4 DNA polymerase
            and EcoRI adaptors were ligated to the blunt ends.

                        polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C2
                        library is a subtracted library derived from the UI-R-C1
                        library, which is a subtracted library derived from the
                        UI-R-C0 library.  The UI-R-C0 library consisted of a
                        mixture of individually tagged normalized  libraries
                        constructed from rat placenta, adult lung, brain, liver,
                        kidney,  heart, spleen, ovary, muscle, 8, 12 and 18-day
                        embryo. The tag is a string of  3-5 nucleotides present
                        between the Not I site and the oligo-dT track which allows
                        identification of the library of origin of a clone within
                        the mixture. The subtracted library (UI-R-C2) was
                        constructed as follows: PCR amplified cDNA inserts from
                        UI-R-C1 clones from which 3' ESTs had been derived was
                        used as a driver in a hybridization with the UI-R-C1
                        library in the form of single-stranded circles. The
                        remaining single-stranded circles (subtracted library) was
                        purified by hydroxyapatite column chromatography,
                        converted to double-stranded circles and electroporated
                        into DH10B bacteria (Life Technologies) to generate the
                        UI-R-C2 library. This procedure has been previously
                        described (Bonaldo, Lennon and Soares, Genome Research 6:
                        791-806, 1996)"

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track served to identify it as a clone from the normalized
            adult Spleen library. cDNA Library Preparation: M. Fatima Bonaldo,
            Ph.D. Clone distribution: clones will be available through Research
            Genetics
            Seq primer: M13 Forward.
FEATURES             Location/Qualifiers

                     /organism="Rattus norvegicus"
                     /strain="Sprague-Dawley"
                     /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                     polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C1
                     library is a subtracted library derived from the UI-R-C0
                     library, which is a subtracted library derived from the
                     UI-R-A1 and UI-R-E1 libraries. The UI-R-A1 library
                     consisted of a mixture of  individually tagged normalized
                     libraries constructed from rat placenta,  adult lung,
                     brain, liver, kidney, heart, spleen, ovary, and muscle.
                     The UI-R-E1 library  consisted of a mixture of
                     individually tagged normalized libraries constructed from
                     8, 12 and 18-day embryo. The tag is a string of 3-5
                     nucleotides present between the Not I site and the
                     oligo-dT track which allows identification of the library
                     of origin of a clone within the mixture. The subtracted
                     library (UI-R-C1) was constructed as follows: PCR
```

```
                     amplified cDNA inserts from  UI-R-C0 clones from which 3'
                     ESTs had been derived was used as a driver in a
                     hybridization with the UI-R-C0 library in the form of
                     single-stranded circles. The remaining single-stranded
                     circles (subtracted library) was purified by
                     hydroxyapatite column chromatography, converted to
                     double-stranded circles and electroporated into DH10B
                     bacteria (Life Technologies) to generate the UI-R-C1
                     library. This procedure has been previously described
                     (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                     1996)"

                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; This library
                      (UI-R-BT0) consists of a mixture of individually tagged
                      normalized libraries constructed from rat hippocampus,
                      thalamus, mid-brain, medulla, corpus striatum, cerebral
                      cortex and testis. The tag used to  identify the source
                      tissue is a string of 3-6 nucleotides present  between the
                      Not I site and the oligo-dT track which allows
                      identification  of the library of origin of a clone within
                      the mixture. This library was then subtracted using a
                      driver consisting of a mixture of all clones from UI-R-A0,
                      UI-R-A1, UI-R-E0, UI-R-E1, UI-R-C0, UI-R-C1, UI-R-C2 and

Statistics: Mean 6.658; Variance 3.138; scale 2.122

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 418; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

```

```
CC   The term MAR refers to DNA segments isolated from nuclear scaffold
CC   or nuclear matrix prepns. after endonuclease treatment. Two
CC   fragments, MAR1 (maize 0.8 kb AT rich region) and MAR2 (maize 1.25
CC   kb regions with ARS3), found withing a 5 kb maize EcoR1 fragment
CC   have nuclear matrix binding activity. The sequence of the MAR1
CC   fragment is given in Q78182 and that portion of MAR2 not previously
CC   sequenced is given in Q78183 along with the published portion of
CC   MAR2 named ARS3 (Berlani et al. 1988 Plant Molecular Biology 11:
CC   173-182). Additionally the sequence from the SAR(L) a region from a
CC   small heat shock gene (MAR3) (soybean HSP17.6 0.4 kb SARL) is shown
CC   in Q78184 (Schoffl et al. Transgenic Res. 2 93-100 (1993)). MAR1,
CC   MAR2 and MAR3 were cloned to construct plasmids pZ01927, pZ01929
CC   and pSVB20-SAR(L) for gene activity.

PT   Polypeptide(s) comprising repeated unit amino acid sequences, also
PT   cDNAs - derived from minor ampullate spider silk proteins and used
PT   to form spider silk fibres
PS   Disclosure; Fig 2C-D; 86pp; English.
CC   Several regions of the cDNA clone, pMISS2, encoding the orb web spider
CC   minor ampullate silk protein MiSP2 have been identified and sequenced.
CC   This sequence encodes the carboxy terminal of MiSP2. Repeat unit peptides
CC   make up spider silk proteins (spidroins) which in turn aggregate to
```

```
CC   form the silk fibres. Spider silk fibres have high tensile strength
CC   and significant elasticity. An isolated cDNA clone of a silk protein
CC   encoding sequence is of use to produce the protein at high yields
CC   using recombinant DNA technology.

PT   Rat and human cerebellum-derived growth factors - used in the
```

```
PT   treatment of neuronal injury and proliferative disorders
PS   Claim 17; Pages 63-66; 94pp; English.
CC   The present sequence encodes rat cerebellum derived growth factor 1
CC   (CDGF1), which can be used to screen for modulators of CDGF
CC   binding to erbB type receptors. Identification of a modification or
CC   mutation in a CDGF gene, or aberrant expression of a CDGF gene or
CC   levels of soluble CDGF may be used to indicate the risk of unwanted
CC   cell proliferation or differentiation.
CC   CDGF may be used to induce neuronal differentiation in stem cell
CC   culture, and maintain the integrity of a terminally differentiated
CC   neuronal cell culture, e.g. useful for intracerebral grafting to
CC   alleviate behavioural defects. CDGF may also be used in nerve
CC   protheses to repair central and peripheral nerve damage, especially
CC   where a crushed or severed axon is entubulated by a prosthetic.
CC   CDGF may also be used to enhance neuronal cell survival in the
CC   central or peripheral nervous system, to treat neurological
CC   conditions associated with nervous system injury, e.g. traumatic,
CC   chemical or vasal injury and deficits such as ischaemia resulting
CC   from stroke, infectious/inflammatory and tumour induced injury,
CC   chronic neurodegenerative disease including Parkinson's and
CC   Huntingdon's, amylotrophic lateral sclerosis, spinocerebellar
CC   degeneration, chronic immunological disease of the nervous system
CC   including multiple sclerosis, disorders of the sensory neurons and
CC   degenerative diseases of the retina. CDGF may also be used to treat
CC   neoplastic or hyperplastic transformations, particularly of the
CC   central nervous system, e.g. amalignant gliomas, medulloblastomas
CC   and neuroectodermal tumours.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 2036; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
```

```
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Nucleic acid encoding secreted protein from human peripheral blood
PT   mononuclear cells - useful, e.g. as immunomodulators, antitumour
PT   agents, promoters of tissue growth, haemostatic and thrombolytic
PT   agents etc.
PS   Disclosure; Page 37; 52pp; English.
CC   This cDNA sequence comprises the 3' end, including the polyA tail,
CC   of cDNA clone C195_4 (see V04274) that codes for a novel secreted
CC   protein (see W41601) of human peripheral blood mononuclear cells
CC   (PBMC).  Clone C195_4 (ATCC 98079) was isolated from a PBMC cDNA
CC   library using methods which are selective for cDNAs encoding
CC   secreted proteins.  C195_4 can be used to express recombinant
CC   secreted proteins; as a tissue/molecular weight marker; for
CC   chromosome identification; to identify possible genetic disorders;
CC   to isolate new related DNA; as a source of PCR primers; to generate
CC   anti-protein or anti-DNA antibodies; in interaction trap assays to
CC   identify sequences that encode interacting proteins etc.  The
CC   C195_4 secreted protein may have a number of biological activities.

PT   Stabilised exogenous genes for plant cell transformation - with
```

```
PT   at least one stabilising DNA segment in 3'- or 5'-flanking region
PS   Example; Page 36; 53pp; English.
CC   The term MAR refers to DNA segments isolated from nuclear scaffold
CC   or nuclear matrix prepns. after endonuclease treatment. Two
CC   fragments, MAR1 (maize 0.8 kb AT rich region) and MAR2 (maize 1.25
CC   kb regions with ARS3), found withing a 5 kb maize EcoR1 fragment
CC   have nuclear matrix binding activity. The sequence of the MAR1
CC   fragment is given in Q78182 and that portion of MAR2 not previously
CC   sequenced is given in Q78183 along with the published portion of
CC   MAR2 named ARS3 (Berlani et al. 1988 Plant Molecular Biology 11:
CC   173-182). Additionally the sequence from the SAR(L) a region from a
CC   small heat shock gene (MAR3) (soybean HSP17.6 0.4 kb SARL) is shown
CC   in Q78184 (Schoffl et al. Transgenic Res. 2 93-100 (1993)). MAR1,
CC   MAR2 and MAR3 were cloned to construct plasmids pZ01927, pZ01929
CC   and pSVB20-SAR(L) for gene activity.

PT   TNF receptor death domain ligand proteins and inhibitors of ligand
PT   binding  - for prevention and treatment of pref. anti-inflammatory
PT   conditions, e.g. auto-immune disease, graft versus host reaction
PT   osteoporosis, etc.
PS   Claim 29; Page 43-45; 83pp; English.
CC   The present sequence, clone 1TU (ATCC 69848), encodes a tumour necrosis
CC   factor (TNF) receptor 1 (R1) death domain (DD) ligand (see R95330). A
CC   yeast genetic selection method, the "interaction trap", was used to
CC   screen W138 cell cDNA libraries for proteins that interact with the DD
CC   of the P55 type 1 TNF-R. Clone 1TU is believed to be a partial cDNA
CC   clone of a longer full length coding sequence (not given in the
CC   specification), however the protein encoded by 1TU does bind the DD of
CC   TNF-R1. TNF-R1-DD ligands and their inhibitors are useful in the
CC   prevention and treatment of anti-inflammatory conditions and other
CC   conditions such as cachexia, autoimmune disease, graft versus host
CC   reaction, osteoporosis, diabetes, etc.

PT   Tumour necrosis factor receptor P55 type death domain ligand
PT   proteins - useful for preventing or ameliorating inflammatory
PT   conditions
PS   Claim 29; Page 46-48; 103pp; English.
CC   This sequence represents the coding sequence of the invention. This
CC   sequence was isolated from clone 20DD and encodes a tumour necrosis
CC   factor receptor P55 type (TNF-R1) death domain (DD) ligand protein. A
CC   host cell containing this sequence is used for the recombinant production
CC   of TNF-R1-DD. The TNF-R1-DD ligand protein can be used in a method to
CC   identify inhibitors of TNF-R DD binding. The TNF-R1-DD ligand protein,
CC   insulin-like growth factor binding protein-5 (IGFBP-5, has TNF-R1-DD
CC   ligand activity) or inhibitors of TNF-R1-DD ligand protein are capable of
CC   preventing or ameliorating an inflammatory condition, preferably by
CC   inhibiting TNF-R DD binding. Identification and isolation of ligands
CC   allows their effects upon TNF-R signal transduction and use as
CC   therapeutic agents for treatment of TNF-induced conditions to be
CC   examined.

PT   Bacillus thuringiensis genes encoding diptera-active toxins - and
PT   transformed microbes used to control insects in various
PT   environments.
PS   Claim 1; Page 10; 20pp; English.
CC   The sequence was obtd. from plasmid pMYC1625 which was isolated
CC   from a genomic library prepd. from DNA from B.t. PS71M3 (from
CC   B.t. PS71M3-69 (NRRL B-18515)].  It is related to the cryIVA
CC   family of genes, the 140 kD endotoxin gene and the type II gene
CC   from B.t. var. israelensis.  The gene encodes a 130 kD protein.
CC   Microorganisms transformed with the DNA may be administered to
CC   dipteran insects or their environments, the expressed toxins
CC   acting as an insecticide.
CC   See also Q14670-Q14672.

PT   Production of icosapentaenoic acid using transformed E. coli  - uses
PT   DNA coding for icosapentaenoic acid synthase derived from Shewanella
PT   strain
PS   Claim 1; Page 19-40; 145pp; English.
CC   The DNA sequence encoding the biosynthetic enzymes of
CC   icosapentaenoic acid (EPA) can be used to transform Escherichia coli.
CC   The DNA sequence allows efficient microbial production of EPA, which
CC   is a raw material for drugs, agrochemicals, foods and animal
CC   feedstuffs. EPA is also useful for lipid balance correction and as
CC   an antihypertensive, antiinflammatory and anticancer agent.

PT   for haematopoietic cells, also trans-acting transcriptional
PT   binding factors
PS   Example 1; Page 43; 112pp; English.
CC   Individual HL-60 cell-derived cDNAs and their subcloned fragments
CC   were inserted into M13mp18 and M13mp19.  The consensus nucleotide
CC   sequence of the HL-60 derived secretory granule proteoglycan
CC   peptide core cDNA is represented in Q44277.  A 249 bp EcoRI-EcoRI
CC   fragment was isolated from a EcoRI digest of cDNA-H19.
CC   The nucleotide sequence of this fragment (Q50336) contains the
CC   sequence expected for a polyadenylation site and the poly(A)+ tail.
CC   This fragment hybridises to a genomic fragment that encodes the gene
CC   for this proteoglycan peptide core, and thus probalby represents the
CC   next 249 bp of the transcript.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 2110; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   New yeast promoters from chromosome IX DNA fragments - useful for
PT   constructing vectors for expression of heterologous proteins e.g.
PT   cytokine(s), antibodies, etc, in yeast
PS   Claim 1; Page 31; 60pp; French.
CC   The sequences shown in T48041-3 represent novel fragments with
CC   transcriptional promoter activity which are derived from a yeast
CC   chromosome IX library.  The library was generated by isolating yeast
CC   chromosome IX separated by pulsed field gel electrophoresis.  The
CC   isolated DNA was partially digested with Sau3A and ligated into the
CC   plasmid pTG9852.  The fragments were ligated upstream of the phleomycin
CC   resistance gene ble.  The library was transformed into the yeast strain
CC   TGY74.3 by electroporation.  Fragments containing putative promoter
CC   sequences were isolated by growing the transformed yeast in the presence
CC   of phleomycin. In order to verify that the positives transformants grown
CC   were due to promoter activity and not due to reversion, the plasmids
CC   were isolated from the yeast cells and re-transformed into E.coli,
CC   followed by re-introduction into yeast strain TGY74.3.  Of 9600 original
CC   transformants, 20 positives with resistance to high concentrations of
```

```
CC   phleomycin (2 mg/ml) were isolated by the first round of screening.
CC   After the re-introduction into TGY74.3, 4 positive transformants were
CC   isolated which contained the 3 sequences defined above.  This sequence
CC   corresponds to the 3' end of the yeast COX4 gene. The 3' of this sequence
CC   is thought to contain a putative open reading frame of 25 amino acids.
CC   Vectors containing the promoter sequence can be used for expression of
CC   heterologous genes in yeast cells, esp. for prodn. of commercially or
CC   therapeutically useful polypeptides, e.g. cytokines, growth factors,
CC   receptors. anti-coagulants, enzymes or their inhibitors, antibodies,
CC   immunogenic polypeptides, structural or marker proteins.

PT   Human proteo-glycan peptide core protein -
PT   present in effector cells of the human immune system
PS   Disclosure; p; English.
CC   The locus of the gene encoding substantially pure human secretory
CC   granule proteoglycan peptide core protein (hSGP), is on chromosome 10 in
CC   HL-60 cells. HSGP can be synthesised in a biological system, esp. a
CC   cultured mammalian cell where it is translated from mRNA, transcribed
CC   from recombinant DNA. hSGP cDNA, a recombinant DNA molecule contg. DNA
CC   encoding it or a fragment of it, and an antibody capable of binding human
CC   secretory proteoglycan or a fragment of it, are useful as diagnostic
CC   probes for monitoring the activation and involvement of immune effector
CC   cells in health and disease, eg cancer, inflammation and allergic
CC   disorders. The 5' region of the sequence that encodes hSGP is contained
CC   in n91787 and n93373. This sequence is separated from n93373 by an
CC   unknown 6 kb fragment (see FT).

PT   Genes involved in viral infection and tumour suppression - used to
PT   develop products for reducing or preventing viral infection or for
PT   suppressing tumours
PS   Claim 1; Page 63; 101pp; English.
CC   The present sequence represents a viral infection gene. The present
CC   invention describes nucleic acid sequences isolated from rat. The
CC   sequences of the invention comprise 70 viral infection (VI) genes and
CC   8 tumour suppressor (TS) genes. Propagating cell cultures in the
CC   absence of the serum protein (SP) allows selective elimination of cells
CC   persistently infected with a virus from the cell culture. Inhibitors of
CC   the SP can be used for reducing or inhibiting a viral infection.
CC   Inhibitors of the TS gene products can be used to suppress a malignant
CC   phenotype (MP). The methods and inhibitors can be used with viruses
CC   such as HIV, influenza, hepatitis virus or animal retroviruses such as
CC   simian immunodeficiency virus, avian immunodeficiency virus, bovine
CC   immunodeficiency virus, feline immunodeficiency virus, equine infectious
CC   anemia virus, caprine arthritis encephalitis virus or visna virus.
CC   Because the identified genes are non-essential to cell survival, the
CC   treatment methods can be used in subjects without serious detrimental
CC   effects to the subjects.

PT   Helicobacter pylori nucleic acid sequences and encoded
PT   polypeptide(s) - useful in vaccines to treat or prevent H. pylori
PT   infection and for diagnosis of H. pylori infection
PS   Claims 5,6; Page 275; 1145pp; English.
CC   This sequence encodes a H. pylori protein of unspecified function.
CC   The protein may be used in a vaccine to prevent or treat H. pylori
CC   infection or to identify H. pylori polypeptide binding compounds,
CC   useful as potential H. pylori life cycle activators or inhibitors. The
CC   DNA and probes derived from it may be used for the identification of
CC   H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic
CC   acid sequences complementary to the DNA act as antisense sequences and
CC   can be used to prevent the translation of H. pylori mRNA. Antibodies
CC   against the protein can be used in immunoassays to evaluate the abundance
CC   and distribution of H. pylori-specific antigens. The genomic sequence of
CC   H. pylori (ATCC 55679) was determined from overlapping contigs generated
CC   by mechanically shearing the bacterial DNA. The sequences were analysed
CC   for ORF of at least 180 nucleotides, and the predicted coding regions
```

```
CC   defined by computer evaluation. To identify likely H. pylori antigens for
CC   vaccine development, the amino acid sequences predicted from various ORF
CC   were analysed for significant homology to other known or exported
CC   membrane proteins. Having identified and determined the sequences of
CC   interest, particular regions can be isolated from H. pylori by PCR
CC   amplification for recombinant polypeptide production, e.g. in E. coli
CC   hosts.

PT   Borrelia outer membrane proteins Oms28, Oms45 and Oms66 - used to
PT   induce immune response against Borrelia in an animal
PS   Claim 18; Fig 10; 132pp; English.
CC   The DNA sequence is of a gene, oms28, that encodes a Borrelia
CC   burgdorferi sensu stricto outer membrane porin protein, Oms28,
CC   which has a porin activity of 0.6 nS in 1 M KCL. Other Oms proteins
CC   are known, but Oms28 is the only one not expressed by other spirochetes,
CC   and appears to be specific to B. burgdorferi sensu stricto, an organism
CC   that initially causes a flu-like systemic illness that, if untreated,
CC   may develop into a disease characterised by arthritic, cardiac and
CC   neurological involvement. The Oms proteins can be used immunologically as
CC   vaccines for diseases caused by Borrelia, e.g. Lyme disease, a tick borne
CC   infection caused by B. burgdorferi sensu lato. The antibody against
CC   Oms28, or a nucleic acid probe for the coding sequence of Oms28, can be
CC   used to detect Borrelia in a sample.

PT   Expression vectors contg T-cell DNA sequences - coding for T-cell
PT   trans membrane proteins
PS   Claim 1; Fig 3A-3B; 56pp; English.
CC   Q63613 encodes a novel T-cell multiple transmembrane protein (R53466).
CC   The novel gene, 19.5, also referred to as Lov, is inducible in
CC   SL 12.4 cells (CD4 CD8 double negative phenotype, therefore
CC   resembling thymocytes at a relatively early stage of development.).
CC   The Lov gene has been mapped to murine Chromosome 16. Its gene
CC   product is developmentally regulated and plays a role in T cell
CC   development. The gene transcript appears to be highly expressed in
CC   ovaries and gut associated lymphoid tissue (GALT) as well as
CC   thymus. The T cell protein may be useful for manipulating
CC   regulation of T cell development, altering the tumourigenic
CC   phenotype and localising metastatic foci of tumours, and for
CC   producing antibodies which may be used to identify or target drugs
CC   or other agents to specific cell types expressing the proteins.

PT   Nucleic acid molecules comprising part or all of the BRCA2 cancer
PT   susceptibility gene - useful for diagnosis, prognosis or therapeutic
PT   treatment of cancer
PS   Claim 10; Fig 7; 124pp; English.
CC   The present sequence represents exon 25 and the intron boundaries of the
CC   BRCA2 cancer susceptibility gene. The nucleic acid molecule can be used
CC   to construct probes for screening cDNA or genomic libraries, sequencing
CC   positive clones obtained, and assembling the full length BRCA2
CC   sequence. The BRCA2 nucleic acid molecules and proteins are
CC   useful in a method of medical treatment, preferably gene therapy,
CC   especially for treating cancer, where the cancer is female or male
CC   breast cancer, ovarian, prostate or colorectal cancer, ocular melanoma
CC   or leukaemia. In particular antisense oligonucleotides capable of
CC   hybridising to the BRCA2 nucleic acid, pre-mRNA or mature mRNA are used
CC   so that the expression of the BRCA2 nucleic acid is reduced or
CC   prevented. The nucleic acid molecules are also useful in a method for
CC   diagnosing susceptibility or predisposition to cancer in a patient. The
CC   nucleic acid molecules are used to design probes or primers for PCR to
CC   determine or detect the presence of mutations in a sample of nucleic
CC   acid from a patient. The BRCA2 promoter region is useful for screening
CC   for substances which modulate the expression of nucleic acid under
CC   control of the promoter. Antibodies are used to determine the presence,
CC   amount or location in a cell of a BRCA2 polypeptide or its mutant forms.
```

```
CC   The polypeptides are used to screen for binding partners, these are
CC   useful to screen for substances which mimic the activity of BRCA2
CC   polypeptide, which can be used as cancer therapeutics.

CC   signalling cascade in mammalian cells. Vectors containing these
CC   sequences, the encoded proteins, and antibodies (Ab) against them are
CC   used to modulate the effect of FAS-R ligand or TNF on cells that carry
CC   FAS-R or p55-R. This is specifically for treating tumours, HIV-infected
CC   cells or other diseased cells, by control of apoptosis/programmed cell
CC   death. The encoded proteins are mediators of the cell death pathway
CC   initiated by TNF and FAS-R binding, i.e. it mimics or enhances the effect
CC   of MORT-1 where increased cytotoxicity is required. To inhibit the effect
CC   of MORT-1, e.g. in cases of septic shock, graft rejection and acute
CC   hepatitis, sequences encoding antisense molecules or ribozymes, or Ab
CC   against the protein, are used. Compounds that inhibit MACH are
CC   potentially useful for controlling MACH activity e.g. in cases of
CC   autoimmune disease, oligodendrocyte death in multiple sclerosis or
CC   AIDS-inhibited T-cell suicide. The MACH proteins can also be used to
CC   isolate and characterise other proteins and receptors involved in
CC   signalling and for Ab production. The Ab can be used to purify the new
CC   proteins and for diagnosis of conditions involving abnormal function of
CC   FAS-R mediated cellular effects.

PT   disease
PS   Claim 1; Page 80-82; 114pp; English.
CC   A cDNA library in lambda ZAPII was constructed from B. burgdorferi
CC   N40 and screened with rabbit anti-serum against N40.  6 Positive
CC   clones, not contg. OspA, OspB or flagellin genes, were selected.
CC   1 of these contained the S1 gene (Q83838) that encoded a 48.9 kDa
CC   protein (R69630). The protein may be used in the development of
CC   multimeric vaccines.

PT   New DNA encoding MACH protein that interacts with MORT-1 protein -
PT   to mediate intracellular effects of FAS or TNF receptors, partic.
PT   for regulating apoptosis in tumours, virus-infected cells etc.
```

```
PS   Example 3; Page 130; 163pp; English.
CC   T61396, and T61405-T61411 represent coding sequences for different
CC   isoforms of MACH. MACH is a binding protein for the mediator of receptor
CC   toxicity (MORT-1) protein. MORT-1 binds to the FAS ligand receptor
CC   (FAS-R) death domain region, and triggers part of the cell death
CC   signalling cascade in mammalian cells. Vectors containing these
CC   sequences, the encoded proteins, and antibodies (Ab) against them are
CC   used to modulate the effect of FAS-R ligand or TNF on cells that carry
CC   FAS-R or p55-R. This is specifically for treating tumours, HIV-infected
CC   cells or other diseased cells, by control of apoptosis/programmed cell
CC   death. The encoded proteins are mediators of the cell death pathway
CC   initiated by TNF and FAS-R binding, i.e. it mimics or enhances the effect
CC   of MORT-1 where increased cytotoxicity is required. To inhibit the effect
CC   of MORT-1, e.g. in cases of septic shock, graft rejection and acute
CC   hepatitis, sequences encoding antisense molecules or ribozymes, or Ab
CC   against the protein, are used. Compounds that inhibit MACH are
CC   potentially useful for controlling MACH activity e.g. in cases of
CC   autoimmune disease, oligodendrocyte death in multiple sclerosis or
CC   AIDS-inhibited T-cell suicide. The MACH proteins can also be used to
CC   isolate and characterise other proteins and receptors involved in
CC   signalling and for Ab production. The Ab can be used to purify the new
CC   proteins and for diagnosis of conditions involving abnormal function of
CC   FAS-R mediated cellular effects.

PT   DNA encoding 2F1 receptors that inhibit prostaglandin synthesis -
PT   for treatment of inflammatory diseases, e.g. arthritis, allergy,
PT   asthma, etc.
PS   Claim 3; Page 31-33; 49pp; English.
CC   cDNA clone hu2F1 encodes a novel human receptor protein designated
CC   2F1 (see W31907) that is a member of the interleukin-1 receptor
CC   (IL-1R) family.  It was obtained by subjecting a human artificial
CC   yeast chromosome, CO2133, containing DNA from chromosome 2q12, to
CC   PCR using primers based on IL-1R sequences.  The human cDNA was
CC   used to isolate the corresponding murine gene (see T88775).  Some
CC   human clones lacked the codon for Ala-298.  The isolated cDNA can
CC   be used for production of recombinant 2F1, especially soluble 2F1,
CC   in transformed host cells for use in claimed methods of inhibiting
CC   prostaglandin synthesis in a mammal, and of reducing inflammation
CC   in a mammal (e.g. for treating arthritis, allergy, asthma,
CC   inflammatory bowel disease, fever, diabetes, dysmenorrhoea, etc.).
CC   Since 2F1 can inhibit NF-kappaB activity, it may also be used to
CC   reduce expression of human immunodeficiency virus in infected cells
CC   (not claimed).  Fragments of DNA are useful as probes to isolate
CC   related sequences, in hybridisation assays and as sense or
CC   antisense molecules to block expression of 2F1 protein.

COMMENT     On Aug 18, 1998 this sequence version replaced gi:2689208.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ11703  Contig_ID: 02265  acc=AL020995
            Length: 62095 bp Unfinished: dJ11703  Contig_ID: 02899

  TITLE     Direct Submission
  JOURNAL   Submitted (07-MAR-1996) Schizosaccharomyces pombe chromosome I
            sequencing project, Sanger Centre, Hinxton Hall, Hinxton, Cambridge
            CB10 1RQ E-mail: barrell@sanger.ac.uk
COMMENT     Notes:
            Details of yeast sequencing at the Sanger Centre are available on
            the World Wide Web.
            (URL, http://www.sanger.ac.uk/yeast/home.html)
            Protein coding regions (CDS) have been predicted with the help of
            computer analysis using the Genefinder program in PomBase (an ACEDB
            database) with additional predictions for the branch-acceptor sites
            supplied by the program Sp3splice. CAUTION: It is possible that for
            any individual CDS we may have underestimated or overestimated the
            number of introns/exons or we may not have chosen the correct
            splice donor/acceptor sites.
            CDS are numbered using the following system eg SPAC5H10.01c. SP (S.
            pombe), A (chromosome 1), c5H10 (cosmid name), .01 (first CDS), c
            (complementary strand).
            The more significant matches with motifs in the PROSITE database
            are also included but some of these may be fortuitous.
            The length in codons is given for each CDS.
            IMPORTANT: This sequence MAY NOT be the entire insert of the
            sequenced clone.  It may be shorter because we only sequence
            overlapping sections once, or longer, because we arrange for a
            small overlap between neighbouring submissions.
            Cosmid c22E12 is overlapped at the 3' end by cosmid c22E12.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            This clone is from the first BAC library from Genome Systems, Inc.
            (http://www.genomesystems.com).
            Cell line:  lymphoblastoid
            Haplotypes:  two
            VECTOR:  pBeloBAC
            Selection:  chloramphenicol
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ1194E15; the clone sequenced
            to the right is RG370M10, 200 bp overlap.  Actual start of this
            clone is at base position 1 of GS465N13; actual end is at 85579 of
            GS465N13.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            Clone RG293F17 is from a release of the human BAC library
            CITB-HS-A.  The library contains cloned DNA from human sperm.  See:
             Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
            Kim et al., Genomics 34:213-8 (1996).  The clone is available from
            Research Genetics, Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the right is RG326G04, 200 bp overlap.
            Actual start of this clone is at base position 1 of RG293F17;
            actual end is at 116215 of RG293F17.

            This clone contains STS sWSS2601 (NID:g1222836).

            This clone RG293F17 contains a bacterial transposon from base
```

RESULT    8
LOCUS     HS501N12   170952 bp    DNA             PRI       24-JUL-1998
DEFINITION  Homo sapiens DNA sequence from clone 501N12 on chromosome
            6p22.1-22.3 Contains a gene almost identical to four genes of
            unknown function, a pseudogene, three (pseudo?) genes similar to
            genes of unknown function, an unknown gene similar to a rat EST, a
            PX19 LIKE pseudogene and another unknown gene. Contains ESTs, STSs
            and GSSs, complete sequence.

  TITLE     Direct Submission
  JOURNAL   Submitted (06-JUL-1998) E-mail enquires: humquery@sanger.ac.uk
            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Jul 1, 1998 this sequence version replaced gi:2980811.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above. This sequence is the
            entire insert of clone 501N12. This sequence has been finished
            according to sequence map criteria as follows. An attempt is made
            to resolve all sequencing problems, such as compressions and
            repeats, but not necessarily within known annotated human repeat
            sequence elements (e.g. Alu). Where the sequence is ambiguous,
            there is an annotation using the 'unsure' feature key.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 6, constructed in collaboration by the Sanger
            Centre chromosome 6 mapping group and Armin Volz & Andreas Ziegler.
            Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr6/ 501N12 is from the library RPCI3
            constructed at the Roswell Park Cancer Institute by the group of
            Pieter de Jong. For further details see
            http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.

  TITLE     Direct Submission
  JOURNAL   Submitted (03-FEB-1998) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Feb 3, 1998 this sequence version replaced gi:2815559.
            The Staden databases, finishing information, and all
            chromatographic files used in the assembly of this clone are
            available from our anonymous ftp site.

            All repeats were identified using RepeatMasker: Smit, A.F.A. &
            Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html.

COMMENT     [2]  corrected sequence for [1].
            [2] provided revised sequences for [1] because there were several
            errors in the published sequences. the sequences provided by [2]
            are used in this entry. the revisions have not been noted.
